> in the 2meter band, being able to hook into repeaters and make phone
> calls thru it.

Hi Tim,

This explains why I've been getting a dead carrier in the 457.xxxx range
frequencies everytime I drive by a Toys R US, Hechingers or Home Depot
store. Hechingers and Home Depot are Home Supply/Hardware Stores in
the Washington DC area.

I wonder if anyone out there has come across one on 35.02/154.600???

Thanks,
Bob

1879. Dual Band HandHeld

I'm looking for the best dual band handheld out there. I need the following features.

1> Alpha Tagging
2> Easily modified to receive cellular
3> Easily modified for extended transmit(important)
4> PL encode/decode
5> Fast scanning
6> 100 memory channels
7> Like to have aircraft band
8> Must be 5W at max power

I'm assuming one of the AOR's is an option. Icom and Yaesu come to mind too. Kenwood's been putting out ok radio's too.

Lemme know ASAP. I'm looking to spend $500-600.

Redirect Flames,quotations of law, and other BS to /dev/null or nil:.

WHAT A CONCEPT...>NO ONE HAS SEEN....

Tell me a story about how lousy RS is and
usually the JAPANESE will rush in and begin
their own Chain of "Tokyo Shack's" all across
the country...

Why has RS been allowed to fester so long?

If you will look carefully you will see stores
closing all the time. Especially on West Coast
States.

How come someone has not "had a better idea than
RS" and start the process immediately following
the next commercial. Question Mark.

Maybe OFFICE DEPOT or MAX would be a good outlet
for a new concept based on what RS could not do.
You put the question mark in place.

Dream a new view....give the people a new reason
to let RS die a ominous death....due to a better
way to merchandise products that give better
answers.

RS's motto should be: You have a problem...So Do we.
You have not left yet."

Come on America....rethink the RS concept and start
a new revolution....with great pay and even better
commissions and med and dent and psych and chiro
coverage. With great benefits like: two days off
concurrently. In one month.

There must be an answer to RS which some one can
begin making money off of. And on the exit sign
an addenum says: IF you leave here hating us,
you get to speak to a real live person who will
listen to you....for an appointment dial:......

Just think of RS as an EST'ian concept: working
there because you are an asshole. Allow EST to
be reborn. In order to get this, you would have
had to have gotten it before.

Umbrance is. And your referrent to "get it" needing a question
mark?....wrong. I did not intend it as a question. It stands
alone...a referrent to "get it"....

the word is one of my jollies....it means "to wonder about"....

I posted a definition of words I invented some time ago,
you must have missed reading it and printing it out and
saving it.....

Umbrance is sort of a derivative of the word "umbrage"...

where is the 'cheek guy"?

How many consumers who [think] they need a TV antenna would
even know what efficiency, gain, or bandwidth mean?

Their marketing stuff says "up to 120 miles" because that is
the information Joe Couchpotato wants. He can't understand
anything else.

Now, if the customer is technically inclined, then the more
technical specs should be easily available. Since I haven't
shopped for a TV antenna lately (we've got cable), I don't
know if that is the case or not.

"Umbrance" is not a word. The correct spelling is "umbrage," and you
should have ended your paragraph with a question mark, not a period.

So how do you explain the above poorly constructed sentence?
If you are attempting to respond in kind to each writer, why
do you end the last clause with a preposition? The phrase
".....get it." appears to be a question, so where is the
correct punctuation? Finally, an ellipsis is three dots,
not five.

Don't attempt to flaunt your education unless you have one.

I hardly every buy stuff from them (other than nickel-and-dime items) for
this very reason. They sell nothing in sealed boxes, everything is in
something which is easily re-packaged and difficult to tell how many
times has been returned. Of course there's also the fact that *I* would
probably want to return almost anything I bought there myself.

Yea, I can't really say anything bad about their antenna selection, except I like the way they rate their antenna gain in reception miles. "Sure, this one will pick up stations to 120 miles UHF." What's the effiecency? What's the gain? What's the bandwidth?

>They make most of their co-axial cable.

Yea, I've seen the co-axial cable. I was getting some RG-6 (I think) for a CB run of 70 feet or so. The guy pulled it off the reel. About halfway down the length, the black outer jacket got very thin, like someone had pulled the taffy too much. there was NO innier anything under that part. It was almost 3 feet long!!!! It's nice to know they have quality controls put in place for the stuff they make. How tough is it to test a piece of cable anyway? Did you ever hear of Time Domain Reflectometry? (sp) You hook up one end of the cable to this machine and press a button. Pass or fail. It's not that tough.

>
>RS manufactures about 30% of what they sell...but about 50% of what they
>manufacture is sold by other companies.
>
It's clear that they don't make the HTX-202 or the PRO-43. These items are both worth their sale price of $200 and $289 respectively. That's the only good thing I can say about Rat Shack other than their selection of parts and their hours on a readily available basis. It's nice you can order stuff through the mail from them now, but it's always a pain to walk in there and have some idiot hound you about buying a part you don't want or need.

I ask a simple question. "Do you have learning remote controls that can learn from another remote directly.

Sales droid # 1:

No, we don't.

Sales droid # 2:

Yes, they are in that case right there.

No, those are preprogrammed remotes. I want a learning remote that you can program from another remote directly.

Sales idiot # 2: "Sure, there is one there that can be programmed over the phone."

Did I say phone? I think I said programmed from another remote directly.

Sales stupor # 2: "You don't need that. This one can be programmed over the phone." "All you do is call this number and tell them what tv you have."

SIGHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHHH.....

Nevermind...I'll go somewhere else.
frustrated customer exits store full of sales idiots

>Need more?

It sure comes into my home unwelcomed all the time. What would you call that? Cable theft is different. Cable is a service provider that I pay a premium for. If I want to watch those premium channels, I pay the premimum because he runs the cable into my house at my request. If he runs a microwave link that happens to go through my house, I'm picking up whatever I want to because I didn't "ask" him to do that.

>(County Sheriff?) -- BUT here in NY they CAN NOT, according to the law,
>CONFISCATE your scanner. They CAN write you a ticket for the
>use/possession of it in your vehicle, but CAN NOT confiscate it.

I beg your pardon? When did that change? They can either
confiscate the scanner, or if you cannot surrender it they
can and will impound the whole car.

Dave -- read just more than the law -- case law says the cop who gets you
for it can NOT confiscate the scanner. I should probably therefore clarify
and say the judge may be able to IF found guilty.

1900. FREQs: Flight med. WI/IL

Newsgroup: rec.radio.scanner
Date: 1996-10-21 00:00:00 UTC
From: jw@alpha1.csd.uwm.edu
Message-ID: <54gbkm$av0@uwm.edu>

Am looking for the "flight for life" type of freq. for the Chicago and
Madison, WI area.

I have the Milwaukee and McHenry Co. ,IL Flight for life on:

129.275mHz Flight following
154.34 mHz Patient follow up reports
463.175/468.175 split pair for patient follow-up (this pair
most freq. used, but may use any of the 10
463/468 pairs e.g 463/468.000, 463/468.025,
463/468.050 etc)

Any input of others in this area???

I was doing a scan between these two frequency ranges and it sounds like cellular phones... Is this possible? I know it's not 900 Mhz portable phones as the callers are in there cars...

Thanks!

Annoucement : Liaison (http://www.pfi.co.uk/liaison/)

There is a new 'website' that brings a new and exciting angle to online conferencing ala AOL and CompuServe , for free , and aimed at you the UK audience.

Paticipate in discussion groups, debates, find information, and meet people , all for free. Special 'city' groups have also been created to provide a platform for discussion within a particular locale , if something is happening in your town or city you can now discuss it.

If you would like to set up a Forum for your interest or hobby, or for your Town or City , then that too can be done online, for free, and in no time.
'Liaison' has already picked up Top 10 awards from YELL and the Gold Medal Award for Web Excellence.

URL is : http://www.pfi.co.uk/liaison/

Regards,

Liaison Webmaster

Hospital ER/Ambulance Radio (system/network). A freq that an ambulance can use to alert a hospital ER that they're enroute with a patient & let them know the patient's condition, etc. ER staff can also give EMTs medical instructions over the net.

Give your brain a rest and stand up fellah....

Why does there have to be a question mark right "there"?

I said what I said and you refuse to listen to what I said
in the sentence I wrote...which i cannot nor someone elses
see anything wrong with it....get it!

the ellipsis is your ritual and your anal savings....not mine.
create your perfect world when you take a crap at your
expense....quit making like the world evolves due to your
demand for anal extraction of a system you "remember as" being
something which when seen in a new way...brings out the
true anally fixated....

Sniff your own and allow it to quiet you.

RE<<Radio Shack: "You've got questions....We'll bug the hell out of you!">>

I love it! It is so true. But I have one better. Over the summer I had a problem with a Uniden Scanner, after being on hold with Uniden's Customer Service for 45 minutes I finially get this droid on the phone. I explain my problem to him and his reply is " I suggest you bring your BC-3000 over to Radio Shack". Being a little neive I said, "Oh, that's great... when did you bring them on board as an authorized service center?" The guy then says, " There not, but maybe they can show you how to use your scanner"..... Now I have been scanning for 20 years, what I have is a design flaw in the production of the Bearcat Scanner, not a miss-use in it's operation. I then replied: Well, what is some idiot at Radio Shack gonna do for me? Probably look at me like I have 6 heads. Besides, I allready spoke with 4 other BC-3000 owners with the same problem.

> Yeah, right-I do the _same_ thing all the time :)

Right. You never turn on FM-105 while typing. Never turn on the scanner
while typing, either, eh? Gotcha.

Incidently, get a ham license and try doing some public service once in a
while. Might help you learn relate to people a little better, and might
even possibly help develop in you some sense of compassion and caring.
Helping people is a good thing. You should try it, rather than being mean
to them.

> > First damned thing the scanner stopped on was a conversation my next

May someone should shoot YOUR dog. You're sick man. Also, rather cruel. Also, probably about 13, or younger.

> > While they were talking about the confrontation with mom, I quickly ran
> > into the living room where we have our video camera set up to monitor the
> > things going on outside of our home
> Sounds like it's really helping...

Nope. In fact, they thought it was fake, and actually kept on performing for the camera in fact for a little while. We've not tried to hide it. In fact, I've even told neighbors about it. I even got permission after the lawn drive-overs and the mailbox bashings to aim our floodlight partly into the road deliberately, to catch vehicle colors and colors of clothes worn by people, at night. They appreciated the idea even. I think they like it that ONE person in the neighborhood chooses to stand up and try to DO something about it. (Yah, I know. Unlike them, right?) The reason for this is because the video we actually HAVE of the vehicle which actually hit our mailboxes is rather unuseable. As the vehicle passes under the orange streetlight, all you get are shades of lighter and darker orange. Hardly helpful. Gave it to GPD anyway, though. Maybe they can manipulate it or something; find something in it with their equipment that I can't with just my VCR and TV. That video was taken the very NIGHT we bought the camera. Two days before is when the lawn-treading incidents occured in our neighborhood.

At any rate, they told me that the best thing I could do is to videotape everything and build up a library. So...that's what we're doing.

> > (we recently had our lawn driven over
> > and our mailboxes smashed), and held the scanner up to the camera so that I
> > would get the audio anyway, with a time and date stamp.
> _I_ trust you, you would never fudge the time/date stamp (would you?)

Welp, considering the camera's been running for the last two weeks, 24 hours a day, and the tapes are constant one behind the other, 8 hours each unending (using T-160's in SLP mode)...kinda hard to say you're fudging a time/date stamp, bud.

BTW, The camera doesn't tape it; just views it. We have the camera hooked up to the VCR with a cable, and we let the VCR do the recording. I can see your next harassment coming.

However, if you think this so against the law, call GPD yourself. They'll tell you what you told me...as long as you don't go zooming in on someone's window., it's perfectly legal. Wish I knew that long ago.

> ten or so years and _now_ he's driven you to these drastic steps?...

It was only up until NOW that we've been able to finally CATCH him in the act. (Or should that be plural?) It's only until now that we could even AFFORD a video camera, and then, the one we got ain't fancy, either. But then, you don't need one with all the special effects to do what we wanted.

Maybe we shouldn't have had as many as we've had. Maybe he should've
stopped at the first request. We've pleaded with him to knock it off many
times.

> > But why did it have to come to THIS
> > do get this jerk to stop picking on us? Why did we have to buy video

> > us and other neighbors, too, on tape.)
> I don't even want to know what 'things'......

Oh well.. You're the one who decided to respond. But, some of those
things include: Driving up on our lawn, driving golf balls at other
people's homes at 1am in the morning, throwing trash in our back yard and
that of other neighbors, slicing up our front yard bushes with their
golf clubs, etc.

> Wow, what a terrific story!! This is the best thing on this newsgroup
> since, since...since...-oh, for awhile, anyway!

Yes.

> Oh, gosh, wouldn't miss it for the world!

I'm sure.

> Todd, you are a strange one...

Scott, I'm really not worried what you think. You're probably about to get a bunch of hate mail anyway from a bunch of people in here for the callous and unthinking ways in which you've responded to all this. You really need some help man, about as much as this kid next door needs. Are you sure you aren't him?

I'm really sorry you feel the way you apparently do about people and life. It's not easy growing up is it? I mean people just being so mean to you and all. I understand.

It's not easy being a bully, I'm sure. I mean, people hating you so much and all. It must be hard. I sympathise. But soon you'll enter high school and people will start looking at things in more mature ways and soon you won't have to bully people to get what you want anymore, or to make yourself feel better than them; you'll learn that making friends with people will actually accomplish your goals much better, and that actually learning something in school will make you smarter and that you might even actually begin to have intelligent conversations with them. Keep your chin up, there. It'll happen. Some people just mature at different rates than others. You're just a little behind, that's all. You'll catch up. Don't worry. Now, go back outside and continue playing with your Barbie Dolls and stop picking on your brother. Okay? Now go and have fun. [Pat on the head.]

Incidently, YOU weren't the one who sent that porno message to me were you? There's some guys at FBI who want to know. If it was, let me know. I'll tell them it was a mistake; that you were just a young kid playing around! You didn't really mean it. Right? Just a kid's prank. Right?

...Really. I'll take care of it for you. Trust me.

Take care,

Todd

Geees..... (note the over use of the ellipsis) If we all wrote on
Usenet the same way we write for publication, this would be a very boring
place. This is a *casual* forum, not something that is going to be
edited and put into a library.

>Any info on this scanner will be appreciated!

I bought one from Damark almost a year ago and am pretty happy with it. It is my first scanner too. Mine was a 'factory recoenditioned' unit. The first one they sent was defective, it had no audio. But I returned it and the second unit works perfectly. There were no return hassles.

It works just fine for the routine stuff like police, fire, railroad. The aircraft band reception is a little disappointing. Plan on getting a replacement antenna. I am using the Radio Shack telescoping whip and it really helps the reception.

The SC150 cannot receive cell phones directly, but it is very good at picking up the 'images' so you can hear quite a bit of cellular stuff. (I find it pretty dull myself.) Cordless phones are no problem, it picks them up quite nicely. I frequently use mine as a portable baby monitor receiver (baby monitors use the same freq's as cordless phones.)

Umm, isn't $30 a bit much for a GROUND PLANE antenna (there ain't no
fancy coils or anything underneath the plastic covering); I would think
the Austin Condor rubber ducky is a far, FAR better deal considering
it is the same price and has far greater coverage... there are 150 and 450
Mhz antennas as well as 800Mhz antennas inside it...

Source record: 219731
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I just got SCANCAT Gold for Windows last week and am having a strange problem. I am unable to get the my radio's squelch to close while running SCANCAT (I did get the 800 MHz going, so at least that's a success).

It seems like my homemade interface is working fine: The radio tunes, tracks the computer, reports signal strength and even stops the scanning on a signal. However, all this happens with the squelch open! It seems whenever I bring up the radio window in SCANCAT, the squelch opens and stays open--even the controls on the radio won't stop it.

I have a message into the SCANCAT folks now, but would appreciate if anyone had solved this one already here.

That was a few years ago, yes. I haven't checked lately. What happens is this...Bose and other "brand name" manufacturers make generally high end/high dollar speakers, which ends up being purchased by a small section of the market. RS sells to mostly mid-range buyers...that's where all the customers are. If RS tried to sell a pair of $1000 speakers in each store, there simply wouldn't be enough customers. RS doesn't pretend to be the store with the best equipment in the world. They do have good products at a good price. They do sell some junk, just like any company does, but that's the nature of the business.

Look at it this way...McDonalds sells more hamburgers than anyone in the world, but are their hamburgers the best in the world? No. You go into a McDonalds knowing you are going to get a fast food burger that is priced reasonably. You don't expect to get a gourmet 1/2 pound burger for $.59 or whatever. Same at RS. If you pay $100 for a speaker, you will get $100 dollars worth of speaker (and a 5 year warranty!), not an "oh my gawd I've never heard anything like it" speaker.

I came across a Hechingers store in Reston, VA that's using
457.6125 for an Intercom system that's hooked into their phone
system. You can hear customer calling the store and asking
if certain items are in stock. Hechingers is a Home Supply/
Hardware chain in the Washington DC area.

scanner in an automobile, they'll rip off your $400 scanner in a New York heartbeat, :-{

Dr Pepper -- you should rephrase this. In NY it's illegal to have a scanner in your vehicle unless you are a police officer, a peace officer, OR receive permission from the local governing law enforcement agency (County Sheriff?) -- BUT here in NY they CAN NOT, according to the law, CONFISCATE your scanner. They CAN write you a ticket for the use/possession of it in your vehicle, but CAN NOT confiscate it.

AOR AR-2515 Scanner in excellent condition now $349.00 + Shipping OR
Trade for Dual-band (2m/70 cm mobile tranmceiver OR 1.2 Ghz/220
tranceiver)
Following specs:
AOR-AR3000A style case/display/keypad
Full Cellular enabled
Priority feature
Copy data from log or Frequency to Banks
Link all banks together or group
12 Vdc input
120 Vac adapter included
Modes
Narrow FM
Wide FM
AM
Search Increments
5 kHz
12.5 kHz
25 kHz
2000 Memories
15 programmable Search banks
5-1500 Mhz
10-segment LED signal strenth meter as well as recorded in software
10 db attenuation switch
Triple conversion
Lock
Backlight
RS232 Computer interface
DOS Software included!
Load-up all memories from computer
Load-up computer Software from Scanner memories
All functions controllable by software
Software works with commen Frequency databases
Spectrum Analyzer in software
Bank Maintainance in software
Frequency Database with descriptions in software
Print Bank & Frequency Lists
Link/Unlink banks from software
Cable included!

Hi John,

when you get a chance, can you confirm the input frequency?

It's most likely 467.8375. If that doesn't work then you may
want to try search the following:

467.7375 467.7500 467.7625 467.7750 467.7875 467.8000 467.8125
467.8250 467.8375 467.8500 467.8625 467.8750 467.8875 467.9000
467.9125 467.9250

Thanks,
Bob

Not necessarily. If it's in a flying helicopter, it would be quite expensive to have an antenna on some type of motorized platform which would keep it aimed at the home base while in flight. IMO, it would be more practical just to broadcast the signal omnidirectionally.

Back in the late 60's or early 70's (don't recall which) Radio Shack had a small pocket size transistor radio grey in color called the patrolman (as well as a similar one for aircraft listening) that had am and high vhf (may have had one with low vhf available too). I had one and have no idea where it ever went. Does anyone ever see any of these out there? If so, what type of price does a mint one bring? Thanks for the information.
Regards, Ray Miller N2NJK

Take a look inside the cell phone port and see if by chance,
any of the flimsy contacts may have been bent during repeated
push-on-pull-off of the power cord. If so, this may have
caused a short.

Hi Mark,

I think you're right. I went back and placed a call to the store
from my Cell Phone and was able to hear my own converstation when
I requested more information from the automated greeting. I think
they may be using some type of headset (like the ones a McDonalds)
only they're Full Duplex (the ones for McDonalds are Half Duplex).

I've seen listings in the FCC files for same frequencies that are allocted to McDonalds (35.02/154.600), but could never figure out why a Toys R US would have headsets. This Toys R US was using 457.5875/467.8125 the same combination that used by KFC.

I wonder if it's illegal to listen to them???

Bob

Actually the helicopter in Portland Oregon uses a diection microwave link
to transmit it's TV and FLIR (Yes, KGW has FLIR-Incredible but true)
They even have a big website about the helicopter including the type of
microwave link

http://www.kgw.com

Ray,
This guy is NUKING his NiCds. Some cars have cigarette lighters that are NOT keyed. If it was
shorted it should have blown the fuse built into the charge cord (every cellular charge cord I've
ever seen has a 3-5 amp fuse)

They probably bought the equipment at a bargain-basement price from some
military electronics contractor whose main business is drying up due to
budged cuts. I'm sure the development of this stuff was paid for by the
military, it would be far too expensive for someone to develop just for
the commercial market.

I just bought one and the price was 199 + shipping, comes with demo programs and
doco disk. You WILL have to buy a nibbler at RS for $11.00 to cut the hole in the chasis.
I tried to cut the chassis with a saw and took two strokes and that was it, off to RS I
went!
I thought cutting the hole was the worst part of the whole install, along with the
disassembling
the radio. The only reason the disassembly was difficult was because RS put some sort of
"glue"
on the threads of thier screws. I have it running know, it is the ultimate interface for
your scanner.

The only thing I wish it had was a way the OS535 could emulate the keyboard of the 2035
while
leaving ultimate control to the 2035 CPU. This would allow programming the 2035 from the
535.
I guess in a perfect world this would be the case.

Scott, I'm going to take a chance here. Sigh. I asked a simple question
and about half of the people in this newsgroup took it upon themselves to
insert their own ideas to my story. ONE jerk even sent me a message
regarding child pornography, which I have appended to the end of this
message in a deliberate effort to embarass all of those who also opened
their mouths and ASSUMED.

Here's the story...

We start about 10 or 11 years ago when our next door neighbor's kid, John,
was caught by my mother climbing on the branches of her small tree in our
front yard. She went out and asked him not to do that because she didn't
want the branches broken, or for him to fall and get hurt. John did not
like this, at six years old, and this little kid proceeded to badmouth her
for it. As the years go by, John's contempt for my mother shows in other
ways. We begin to see trash, like broken beer bottles, thrown into our back
yard. My little Dodge Omni, which I would always park in the street by that
very same little tree in front of our house, had its wipers ripped out of
it, the front grill smashed, a headlight smashed with a golf ball, parking
lights broken, bb-type "bullet holes" in the front and rear windshields,
shaving cream sprayed all over the car at one time, and let's not forget the
bubble gum under the handles and over the tire nuts. By the time the kid
was finished with my car, I couldn't get an offer of $50 bucks off it, and
it certainly wasn't street legal to drive anymore. It cost me thousands,
literally, to fix the damage this kid caused to my car.
But we'd never have any witnesses to him doing it. He'd always get away
with it scot-free. The kid had everyone intimidated. The neighbors would
tell me they saw him do it, but that if questioned, they would deny it,

because they feared similar retaliation from him. (John is now 17 years old, barely a minor, by the way.)
We'd also have to constantly fix mars and dents on the front panelling on our house, because he and his friend would play golf from their front yard using real golf balls, and hit them towards our house. When we'd call the police, "We don't USE REAL golf balls, we use there here `wiffle' golf balls." And the cops would leave, leaving us to always fix the damage.
They'd play baseball in their front yard, and hit my vehicle, and our house sometimes.
They'd play football, and regardless of how many times we would tell them not to do so, they would intrude upon our front yard and use it as an extension "field." And always would a football hit the house or my car (again) at sometime.

A year and a half ago, I used to have a cat named BRAN. (Their mother was MUFFIN, and her sister was RAISEN.) We had a deaf friend over one evening and he left late, about 11pm, and couldn't hear to tell that he hadn't shut the door properly enough.

ALL of the cats got out that night.

Only two returned by 4am.

Some kids down the block, two months later, after seeing me with Raisen on my shoulder as I walked around the block with her (like I used to do with Bran and Raisen both when they were kittens), told me that they thought they saw Bran being taken by a neighbor's friend at the end of the street, taken home with her up north. This in a way made things better for me. I mean, I thought it was better to learn that Bran was indeed okay and hadn't been eaten by another local wild or domestic animal, or run over, or killed, or something. She was "with" someone, and thus "okay."
I loved Bran and missed her very much, but I was glad to have some indication that she was "okay."

Then, last week, I'm typing away on the Internet, and I decide to turn on my scanner and listen to the local amateur radio 2-meter repeaters.

I hit the wrong damned bank button. I hit bank 8 instead of bank 0.
Bank 0 has the amateur radio freqs, while bank 8 has the port. phone/monitor freqs, which, a year ago, WERE legal to monitor last I had checked. (Some of the PAramedics used to use those cheap FM headsets during the football games that I used to help out with comms with, and those freqs came in handy in listening to them and getting a heads up on what we needed to do in making some responses and such).

First god-damned thing the scanner stopped on was a conversation my next door neighbor's friend, Mike, was having with his girlfriend.

He was talking about a confrontation he and John had had with my mother the day before, when they were out there yet again playing golf and slicing up her bushes this time. Mom went out there and confronted them. They badmouthed her, of course. And this he was describing play-for-play, word-for-word. Then I hear...

"Yah man...he SHOT their fuckin'...PUSSYcat!" (both parties laugh) John fuckin' KILLED that pussycat with his PELLET gun!" (both laugh again)

While they were talking about the confrontation with mom, I quickly ran into the living room where we have our video camera set up to monitor the things going on outside of our home (we recently had our lawn driven over and our mailboxes smashed), and held the scanner up to the camera so that I would get the audio anyway, with a time and date stamp.

So, there you have your situation. By accident, I turn to the wrong band and accidentally hear my neighbor admitting how my cat was killed for fun with their pellet gun. Mitigating circumstance number 1.
Number 2 is that I still thought those bands were legal to monitor.
Number 3 is that, well, hearing your neighbor brag about killing your pet with his pellet gun for fun is rather shocking and to me rather well justifies any reason for monitoring further.

Which I did, of course...to try to find out more.

There never was more, but there WERE later conversations about drugs.

I called a local special police dept. here in Gainesville and the officer on the phone was VERY happy to say the least. He was ready to set up monitoring, and I would soon have my restitution for everything this little bastard has done to us over the last ten or so years.

Then I told him to wait just a little bit on everything while I go and try to research everything on this to be safe...thus, the query I had put out in this newsgroup re "Laws on Monitoring."

It is THEN that you all tell me about the recent changes to the law.

It is THEN that we both realize...SCREWED AGAIN by this bastard kid. HE kills my cat, I have it on tape, and I can't use it.

Then I start getting these strange rebukings from about half of you for being such a pig as to monitor the "BABY MONITOR" frequencies, and I get the below appended child pornography message from someone I know obviously reads this newsgroup, who was obviously being a sick little smart ass...from people who have absolutely NO idea what is really going on. I've forwarded that message to the FBI and they can deal with it. Hope tht catch that sick bastard who sent it. I have two neices who I care for very much and I don't need those kinds of "threats" from people, as I see it. I get lots of junk mail, yes; but this person obviously came from here and was making another one of those "assumptions," and I'm sure, right about now, whoever it was is feeling INCREDIBLY stupid and bad. I hope so. You deserve it bud. Let it sink in and bother you all night tonight, bud. Then I'd appreciate an apology if you're man enough.

But to continue, during the time that I still thought it was legal - before I put out the query - I did something really stupid.

A couple nightss ago, I was returning home late at 10pm from a friends and making copies of my videotapesss when I swa John outside by his girlfriends car, which, ironically, was parked under the little tree in our front yard.

Angry, and not thinking, I confronted John about shooting my cat. And that's when I found out that what all this boils down to is how he hates my mom for telling him not to climb up on our tree when he was six. That's all it is. That's why he shot my cat; trashed my car, has harassed us, and caused us so much pain. That was it. This, to him, was justified.

That's when I found out that they re moving on Nov. 1st.

By the way, it was just words. Nothing physical. And he never admitted that he shot my cat. Rather, he always avoided the question. Never denied it though. I asked him why he could do such a thing...and to ME? What did *I* do to him personally. No answer. I told him then that "listening" to those bands wsa not illegal, and to watch what he said on them. (Again, t the time, I still thought it WS legl to listen to those freqs.) I shouldn't have told him that for all the reasaons yes that you re all now about to throw my way, but, I was so angry with him. I wasn't thinking.

But, miraculously, would you ll believe that that home next door has been THE most PEACEFUL place you ever heard or saw since then? Amazing.

Meanwhile, I've since told him what I've lerned about the lwa and told him to keep his nose clean until he moves; that he doesn't want to "help" me make this now moral issue decision (for me) that I am deciding upon. That being, to hell with the risk of prosecution -- he shot my cat. Should I report it regardless of wht could happen to me? and rissk MYSELF being put in jail? (I relize tht there are mitigating circumstances in my favor, but tht's not a guarantee of lighter sentence or of even getting off altogether. But I'm SO tempted right now to tke it to the police anyway, regardlesss of what might happen to me. I almost don't care. It's THAT close. I'm thinking on it. But I told him that he doesn't want to HELP me make that decission either way in the meantime, and that it might be best for him to really keep his nose clean until he moves, and, that seems to be the case, at least. So he has tht in his favor. But why did it have to come to THIS do get this jerk to stop picking on us? Why did we have to buy video camera? Why do I hve to run my VCR in record mode now for 24 hours, 7 days a week? That's not fair. (Incidently, we HAVE caught them doing things to us and other neighbors, too, on tape.)

Meanwhile, I now know what hjappened to my cat, and I have to live with the fact that legally (because some Senator got caught with his pants down and unfairly passed a bill protecting the port. phone bands through Congress with such lightning speed that noone was ever able to adequately and properly respond to it) I cannot do anything about it. I have to live with the fact tht there is a kid out there who killed my cat in cold blood for no other resaon than for sick fun and because my mother told him he couldn't climb a tree when he was six. I have to live with that.

Meanwhile, I'm getting sick messages from sick individuals in here who are wondering why *I'M* being so `sick' as to monitor those freqs, and who take it upon themselves to send me such disgusting e-mail as in the below. You guys have NO IDEA what the hell the real story is, and you've opened your mouths and stuck your foot in. I hope you feel bad now.

Is there anyone out there good with tracking false e-mail addresses? or who is good with tracking this kind of stuff down? Please let me know. I'd like to prosecute the below sick nut.

I have dedicated a page about my kitty ``Bran'' at --

http://www.afn.org/~afn09444/author/bran.html

if anyone would like to read it.

Take care,

Todd Sherman

Hi! I sent you this letter because your email address was on a list that fit this category. I am a fan of child pornography and for the past 4 years, I have been able to gather quite a collection of it. I have pictures, VHS tapes, posters, audio recordings, and games based on child pornography. I am now selling my products (or trading for other child pornography).. I have a complete color catalog of all my products now available. You can purchase pictures, both normal kodak, and computer GIF or JPG's. You can purchase posters, the VHS tapes, and Audio recordings. If you send your picture, I can morph your face into one of the action shots to make it appear that you are the one having anal sex with a little boy. There are many preferences you can choose from. Hair color, weight, age, height. Age of the little boys range from 7 yrs to 17. Little girls, age 4 to 19. For $2.99 we can send you a personalized audio cassette of a little boy moaning and groaning your name. There are many other products and services.

If you were not supposed to receive this letter, please delete it immediately. I'm sorry. You will not receive another letter from me.

Here are some prices:

Complete Color Catalog (160 pages).....$5.00
100 Pictures Little boys age 7-12.....$9.95
120 Pictures Little boys age 13-17.....$11.95
VHS tape, little boys "Bath Time".....$49.95
VHS tape, little boys "Happy B-day, Timmy".....$49.95
Personalize Audio tape.....$2.99
Personalized morphed action pic.....$14.95
(be sure to include your picture)

If you have any child pornography yourself, preferably little boys ages 7-9, I will trade or buy them from you. If they are action shots, of an adult with the little boy having sex, I am willing to trade big, or pay a lot. Please write to me for more details. Thanks.

You can send a cash, check, or money order. Make it out to my company :"Kwo Un"

Send your order to:

Child Fun
Attn: Steve Barnard
81-12 Roosevelt Ave., Apt. 608
Jackson Heights, NY 11372

You can also send your credit card numbers. I do not accept American Express cards.

The CE-232 Scanner/Computer Interface will AutoProgram the 2035's 1000-ch memory banks with not only frequencies, but also custom settings of channel, mode, delay and lockout. You can also remotely control the scanner from the keyboard of the PC.....a definite plus, considering the nasty front panel of the PRO-2035.

E-Mail me for more details if you like.

Yes, that is probably it.

The 902-928 band is used for for amateur radio, spread
spectrum cordless phones, and a handfull of other uses.

I would check this. There is a Federal pre-emption of laws that regulate scanner possession by licensed Amateurs. This was done a few years ago and caused many states to re-write their laws. Kentucky is one of these states as is Indiana. They both did so very reluctantly.

Let me guess. You have a dual conversion scanner (i.e PRO-2030, et al). You are receiving images from the cellular band just below 896 MHz. If you subtract 21.6 MHz (or 21.4 depending on the scanner's IF) from each "phone call" you hear, you'll find the actual cell site frequency. If you continue to listen, you are in violation of the ECPA (sic). The only problem with this image reception is that it makes it nearly impossible to search for legitimate stuff in the 896+MHz range. I know, I have the same problem.

Hello Sid,

+12V and -12V are not available on the 25 pins RS232 connector but can made
from other signals.(TxD RTS DTR). Look at circuit.gif for the schematics.

Greetinx,
Jan

Hi
I recently sent a query about 12volt on rs232 line....now i'll put it
another way.

I am trying to build the pocsag interface as show in the pocsag
documentation.
I am having trouble understanding where pin 7 of the 741 chip goes
it just says +12v. similarly with pin 4 this says -12v.

If anyone has successfully build one, can they PLEASE explain where
the voltage comes from, or am I getting it completely wrong !

Looking to make an immediate purchase (this week) of one of the following:

- Optoelectronics Scout Model 40

...or if the price is right:

- Optoelectronics Xplorer

..will do an immediate COD cash purchase (via FedEx, my expense) to whomever can offer an excellent price ASAP. Lowest price first time gets the deal, any mods/accessories included taken into consideration.

Obviously I have a somewhat immediate need but don't want to pay full retail if at all possible. Opto has a special on the Scout at $449 with some freebies like an antenna, carry case and the freq CD...

Please reply to this message or contact me at dmason@nextel.com.

Thanks,

Nope, they are directional antennas and they are microwave. A number of companies manufacture them with radomes over the antenna though, so you cant see the moving parts. On the tower, usually the broadcast tower, the receive antenna also tracks the helicopter. Its quite a complex system with control equipment that keeps the two antennas aligned.

Your thinking of the Radio broadcast. Or perhaps the tv audio from the cameraman is sent on the 450 frequencies. All the video is up in the M/W portion.

Cross-posted to: rec.radio.scanner,rec.radio.swap

I have a number of Cellwave rubber ducky antennas for sale, most with unusual frequency ranges and/or connectors. Most are for sale at 10$ each. These are new, never used, but without packaging as they were demos for a trade show. Please e-mail me if you are intersted at jmckay@interlog.com

Some of the frequency ranges are:

821 Cellular, full band (tx/rx - 870)
806 Trunking, full band (tx/rx - 850)
406-420 UHF
118 VHF Air

Many are with BNC connectors, also some with SMA, some with threaded Motorola type, etc. There are about a dozen in total. Also, some are stubby types, some are full half wave whips, and some of the trunking/cellular ones are the hi gain type.

Sid,
Pin 7 goes to the + supply voltage, usually from the power supply or battery. Pin 4 goes to the - supply voltage (ground). IEEE specs for RS-232 is for + & - 12 volts on the signel line.
Jack

As far as mods for the RS-2026, it depends on when you purchased it. The earlier versions had a very simple mod, just cut one jumper on the control panel. The newer units do not have such a mod, and as far as I have been able to find out, are unmodifiable for cell. The BC760 was similar earlier, but I am unsure now as to whether they have made the same changes as the units they made for RS. Sorry.. (BTW, I have 2 of the newer units, and am just as disappointed, besides, they don't handle intermod well).

1987. Re: AR7000 provisional Information

Cross-posted to: rec.radio.scanner,alt.radio.scanner,alt.radio.scanner.uk

A few questions:

1) Is it base or handheld? If it's a base, is it the successor to the AR3000?

2) How much is it?

3) How does it compare to the AR8000 in performance. It was given a "lower" number, does this imply anything in relation to the 8000?

From: ahawrylyshen@ccgate.hac.com
Message-ID: <aoafteyjbf.fsf@sun6k.i-have-a-misconfigured-system-so-shoot-me>
Source record: 219495

I have been away from scanners for about 7 years and am not
generally aware of what a typical computer 'interface' (serial)
on a scanner will do. I understand that commands can be sent to
the scanner to tune the VFO and assorted other parameters...

Q: Do scanners output the channel # / VFO frequency as they
scan (not search) from memory channels?

Basically I would like to construct a standalone display that
could display an alpha numeric 'tag' for the freq that
is being currently monitored (tuned).

I'd imagine that this could just be done by having the external
device tune the scanner, but that you lose some scan
speed that way. The device would also have to be more complex
than if it only had to look up the frequenct and display a name.

Opinions and comments welcome.

Cheers,
...Alan Hawrylyshen (AR2700 owner)

PS-> Yes, I could have purchased a better scanner...

Could be a ground loop. If you have an isolation transformer available,
plug the desktop into it and plug it into the wall. Disconnect all
external devices that may be connected the computer and to the wall (i.e.
printer, modem, etc.). It will probably be simpler to unplug them from
the wall rather than from the computer, but either will do. Make sure the
monitor is receiving its power from
the computer or the isolation transformer. If you have an internal modem,
disconnect the phone cord from it. If every thing works,
then probably it's a ground loop. If it doesn't work with an isolation
transformer, then it's likely due to improper signal/voltage from the
desktop's I/O port. If you have the proper software and loopback plugs
you can check the signals, but not the voltages. You would need an
o-scope to do that; it's usually simpler to swap in a new I/O card. If it
is a ground loop, then you have to trace down the leak, which could be in
the radio, desktop or interface.

Most phone companies have a "*66 Call Again" feature that you can subscribe
to. The feature will call you back when the line is free and will connect
you up. At least I know my telco (B.C. Tel.) has it, and if your company
is owned by GTE, they would have the same network equipment and services.

Well I baught Pro2006 brand new from a shop for 200 pounds. That works
out at aroung $400. So from that I'd say that $300 is rather over
price for a second hand one.

Richard.

Just today I found the circuit schematic on the WEB for a simple 2 transistor RS232 level translator circuit. I want to get it to work on a simpler Apple port and am looking for interface details for the factory installed PC interface option.

1) How would I obtain a service manual for this radio?

2) Could some one, who has a service manual, post some details on the actual biasing components on the Tx and Rx input pins? I want to determine if the 2 transistor circuit will work on my Apple as it doesn't have all the current sourcing pins of the PC model.

Thanks in advance!

>AR3000?

I saw one at the Leicester radio show. It is a rather small base
station. The display is a square 3 1/2 inch colour LCD, which can show
a digital frequency readout, an analogue one and a spectrum analysis
simultaneously. It uses DSP techniques to provide the various IF
filters. Coverage is 100kHz to 2 Ghz. I have the impression it is a top
of the range model for AOR, and does not replace any of the existing
sets.
>
>2) How much is it?

No-one there would say, but assuming it has good short wave performance,
it could replace a short wave set, an VHF/UHF scanner, and a spectrum
analyser, which represents a substantial outlay! Up to now most wide
range scanners have fallen short in HF performance.

WANTED: ALPHA TESTERS TO UPGRADE THE CPU IN THEIR
PRO-2004 SCANNERS WITH ONE FROM A PRO-2006!
==========

Only the serious and fairly technically competent should apply; this is NOT a casual armchair modification (yet), and there will be some expense involved.

I think it may be possible to swap "engines" in the PRO-2004 to bring it up to PRO-2006 caliber; that is, I think the PRO-2006 CPU can be made to work in the slower PRO-2004. If so, this will yield a trouble-free 30-ch/sec scan and search speed.

For some early PRO-2004's, it will also yield the full expanded cellular bands: 868.950-894.000 MHz and 823.950-849.000 MHz with default 30kHz spacing.

(Early PRO-2004's with the GRE-0327 CPU were firmware'd for 870-890 MHz and 825-845 MHz with 30 kHz spacing, and 12.5 kHz for adjacent bands. Later PRO-2004's with the GRE-0327A CPU had the modern 30 kHz defaults.)

If you are technically competent and would enjoy a little guided Research and Development, and will foot your own costs, estimated to be $60-$100, then contact me by e-mail for more details. No, I am not selling anything - you will be required to obtained parts and materials on your own, according to my specifications and directions. I will provide instructional and guidance materials.

To be qualified for this R&D project, you should possess the following minimum qualifications:

1. Own a PRO-2004 in good operating condition

2. Own or be willing to acquire a service manual
for the PRO-2004.

3. Be willing to modify its Logic/CPU board, PC-3

4. Have some experience at PCB work, including
IC installation and removal.

5. Have some experience with CMOS and SMT devices

6. Purchase a PRO-2006 CPU from Tandy National
Parts (800) 442-2425. Est cost: $50-$60

7. Purchase a pair of 64-pin DIP sockets with
0.07" pin spacing. Est cost: $15

8. Own or acquire basic handtools, and basic
desoldering equipment.

9. Be willing to respect and abide by copyrights
and Non-Disclosure Agreements without fail.

10. Be willing and capable of providing regular
and detailed reports of your work and results
by Internet e-mail.

11. Have an Internet e-mail account available for
daily and regular use, both to send and receive
e-mail.

If interested, contact me by e-mail ASAP.

Intersting comments from Mr. Sundstrom, as always. He does have a point about folks not realising that the more exotic stations aren't exactly easy catches on portables. It can be done however. Probably my best catch was two or three years back, when I heard the Solomon Islands Broadcasting Corporation late one winter night. Their signal on 5020 khz was weak but understandable. A great catch on my Sangean ATS803a and less than opitimal attic random wire. And I'm sure some newcomers, not realising how bad current reception conditions are, have returned their new radios for a refund, thinking there is nothing to listen to on shortwave.

As for Wayne Greene, has a new issue of 73 magazine come out in the last month? The most recent one around here was the September issue. Of course, over the last few months I've been rather amused with some of the content of the magazine, such as a review of a book that claims the moon landings were faked, or the article in the Sept. issue that mentioned so-called "zero point" energy devices. The fringe science stuff I'm sure has turned off some readers.

On the other hand, I hand the pleasure of actually being able to buy the October issue of Monitoring Times at a local bookstore. Its great to see

it finally available locally. Hopefully it will continue to show up.

2014. PRO 2035 Close Out at RS / Q. on memory

Newsgroup: rec.radio.scanner
Date: 1996-10-22 00:00:00 UTC
From: avenger@mail.suba.com
Message-ID: <MPG.cd640b644a63ab0989681@news.suba.com>
Source record: 219575

Gee, do you believe that RS still has vintage 1995 PRO 2035 (1,000 memory "continuous" 25-1.3G) still in stock? My local RS had three of these (claimed new) in a box.

Catalog price was $499. Best price from Grove (according to my stockpile of old catalogs) was $399. RS is finally dumping these at $249. Bought one to add to my collection joining my PRO 2006 and BC 9000 XLT.

Works great, really brain damaged search and store which doesn't understand unique frequencies.

Question. The manual says that the scanner will retain freqs in memory for three months without power. Is this is pre-EEPROM non-volatile memory scanner or is there an hidden button battery inside the case that I missed in my initial inspection.

Thanks
Gary / ke9zm

I guess if I went to a Chevy dealer, I wouldn't expect the salesperson to
know about the cars.

Besides, they opened a new RS here in my town. I went and applied because I figured I had more knowledge about electronics in general (including DSS -> which they seemed very impressed) than any other ordinary person. You know, they never called me back. I went in there after they opened, and some lackey didn't even know what scanner had 800 Mhz. After asking a few obvious questions, the manager finally came out and told me that cellular was indeed blocked from all scanners and had been for a few years. Gee, I thought that was common information...

>THE LAW ? Nope, I don't think so.

So let me get this straight... If I am speeding and get stopped by a
cop.. and he finds that I have a cracked windshield and broken tail
light, he will confiscate my car???? Nope I Don't Think so!!!!!!!

>And if you get caught in
>Virginia, Your scanner AND your Radar detector are BOTH toast.

I think you should revisit this thought. In Virginia, you will not
lose your scanner or radar detector.. If your scanner or radar
detector is confiscated, then either you did something to really piss
off the officer, you were commiting a bank robbery or other serious
crime. They simply do not confiscate these items. If you have a
scanner in the car and are not commiting a bank robbery the officer
might just ask you to put it in the trunk if he even bothers with it.
Radar detectors are handled the same way... put it in the trunk after
you disable it (break the power cord). Then the officer will let you
go away....after he has given you a ticket. Oh, yes, In most states,
even New Jersey, a licensed amateur radio operator can have a scanner
in thier vehicle...

FWIW, the manager of the RS where I shop is an electrical engineer (and a good friend.) During the Korean conflict, he taught radio and radar in the army. After the service he worked for Colesman Industries (NOT the ice chest company) when the company was subcontracted by various government agencies. During the Kennedy administration, he was in charge of monitoring/collecting information gathered during the atmospheric a-bomb tests. He was in Hawaii for the tests...rough assignment!

During the Apollo program, the company was contracted to NASA. He was the project manager for the star tracking system the astronauts used to determine their location while they were between the moon and the earth.

There are several circuits designed by him that are in every B-52 bomber.

I've seen all the signed documents and awards with the various president's signatures that he received for his work.

When NASA quit sending up manned rockets, he got laid off (layed off???)...anyway...he didn't have a job anymore. He had a few bucks in the bank, an engineering degree, and no job...like hundreds of others at the same time. He wandered in to the local RS one day, and after a conversation with the manager, he signed on with the company and has been with it since 1975.

He plans on retiring in a year or two, and is going to do quite nicely, thank you very much. He plunked money into their stock plan and other company investment deals, and made out like a bandit.

Anyway, here is a case where the manager of the RS store is literally a rocket scientist! If you have qestions, he definitely has the answers.

I'm not attempting to fuel any arguments, nor am I trying to prove someone wrong about anything...just passing on a bit of info about one RS store.

Andy

While you are there, ask to check out their frequency counter. Put
the radio and the counter side by side, key the radio and read out the
frequency! (Or ask to look at the owner's manual for the radio).

Mackey, in reviewing your postings of the last few months,
one glaring point has surfaced. The ratio of content to quantity
is profoundly small. Lots and lots of noise, but no substance.
That is unless you are substituting invective for substance.

I suppose in person you might be a pleasant chap. But, the
person you've shown yourself to be here is a sad and
pathetic wretch. Much like someone who is starved for
attention and is willing to endure the wrath of others
in order to get some form, any form of attention. Perhaps,
you are in love with the sound of your own voice and you are
doing the cyberspace equivalent with the massive volume
of your vacuous postings.

No matter. The alt.radio.scanner and rec.radio.scanner
newsgroups have really suffered enough of this spirited
discussion. You have wasted more bandwidth with your
inane bombast than all the other participants combined.
Your actions indicate you really want a monologue with
yourself, not a dialogue with the residents of the
newsgroups. Contentedly, I comply with your request.

There is a Buddhist koan that asks what is the sound
of one hand clapping. A more topic specific version
might be what is the sound of a Mackey posting to
himself.

Sorry Chris, I think you are out of luck. If your scanner had AM capability, it would work, but FM just won't cut it. They are down converters. They take a whole block of spectrum and shift it down to other frequencies. I don't think they are over $100, but it won't help you if you don't have the capability to receive AM. Tyler

There's a special backup battery soldered inside the PRO-2035.

The Radio Shack PRO-2035 Scanner:
How Does It Compare With the PRO-2006?

Copyright 1994 by Bob Parnass, AJ9S

[NOTES: An earlier version of this article was published
in the author's Scanner Equipment column, Monitoring Times
magazine, January 1995. This article may not be reproduced
in whole or in part on CDROMS, in bulletin boards,
networks, or publications which charge for service without
permission of the author.]

Radio Shack recently discontinued the PRO-2006,
perhaps the best base/mobile scanner radio ever sold, and
replaced it with the 1000 channel PRO-2035. Bob Grove
reviewed the PRO-2035 in October 1994 Monitoring Times
magazine. How does it stack up against the PRO-2006? Read
on.

Background

In 1986, Radio Shack introduced the PRO-2004 wide
band programmable scanner and it immediately captured the
attention of hobbyists. The PRO-2004 was made by General
Research Electronics and was different from other models of
that era due to its large 300 channel capacity and nearly
continuous frequency coverage of 25 to 1300 MHz. Key to
the PRO-2004's superior performance over such a wide
frequency range was the use of "up conversion," a design
found in expensive commercial and military receivers.
The PRO-2004 was replaced by the PRO-2005 in 1989,
which was upgraded to the PRO-2006 one year later. The
PRO-2005 and PRO-2006 were manufactured using tiny surface
mount components, and despite a different cabinet, display
panel, and keypad, the PRO-2004 and PRO-2006 circuitry and
features were very similar. The PRO-2006 scanned and

searched faster and was more sensitive. Except for the use of a plastic case, the PRO-2006 was equal to, or better than the PRO-2004.
By 1993, the highly prized PRO-2006 was getting long in tooth. Uniden introduced the Bearcat 8500xlt, the first Bearcat scanner featuring up conversion and a tuning knob. Radio Shack's somewhat late response to the 8500xlt is the new PRO-2035.
The PRO-2035 analyzed in this review was purchased from a local Radio Shack store and bears a serial number near 3000.

Physical

The PRO-2035 is about 5/8" wider and 1/2" taller than the PRO-2006. Extra room in the spacious cabinet will interest experimenters and companies who may provide aftermarket accessories for the PRO-2035.
The dark plastic case has rounded corners, typical of contemporary "European" stying. The squelch and volume knobs are the same dark color as the front panel, and you can't see where they are set as Radio Shack opted not to paint the hairline marker grooves a contrasting color. You can paint a white groove in each knob using a small bottle of White Out correction fluid, a product intended for covering typing mistakes.
Although there is a jack for running the PRO-2035 from a 12 VDC source, Radio Shack refers to this model as a "home scanner."

Frequency Coverage

There is a typographical error on page 3 of the owner's manual which specifies that the PR0-2035 tunes the 470 - 805.750 MHz range. Coverage in this band actually stops at 520 MHz and resumes at 760 MHz. Despite the limits cited in the manual, the PRO-2035 tested for this article tuned 25 - 520, 760 - 823.995, 849.005 - 868.995, and 894.005 - 1300 MHz.
Lately, the most frequently posed scanner question on the Internet and computer bulletin boards is, "How can I modify my scanner to cover the cellular phone range?" The FCC no longer permits companies to sell scanners which cover the 800 MHz cellular phone frequencies or which can be easily modified to cover them. As sold in the USA, the PRO-2035 does not tune the cellular frequencies directly. This raises an interesting question for a product reviewer or scanner experimenter: If he or she finds an easy way to expand frequency coverage into the cellular phone band, should the information be published? Doing so could lead to a product recall.

Memory Features

The PRO-2006 has 400 conventional memory channels and 10 Monitor channels backed up by an ordinary 9 volt battery. The PRO-2035 has 1000 conventional memory channels and 100 Monitor channels backed up by a special 3 volt battery soldered onto the main circuit board. The owner's manual states memory contents will be retained for up to 3 months in the event of a power interruption.
Both the PRO-2006 and PRO-2035 have 10 pairs of search limits, but the PRO-2006 permitted searching only one range at a time. The PRO-2035 is more flexible and allows "linking" search ranges together sequentially. You can set search range #1 limits to 46.61 - 46.97 MHz and search range #2 to 49.61 - 49.97 MHz, for example, and the PRO-2035 will alternate searching both ranges.
Here's a tip: If your favorite search range has one or two birdies, or frequencies you want to skip, you can break the range up into two or more sequential ranges and link them together.
Not only are there a lot more channels in the PRO-2035, but several new ways to manipulate them. By pressing a few keys, you can:

1) zero all 100 memories in any single bank

2) zero all 1000 memories in all banks

3) zero all the locked out memories in any bank

4) display the number of "empty" channels in any bank. The PRO-2035 owner's manual refers to memories which contain 0.0000 as "empty" memories.

5) move all the nonempty channels in a bank downwards to fill in the empty channels in the bank

6) transfer multiple Monitor channels into one or more banks

7) transfer all the channels in any bank into the Monitor channels

With so many channels, the PRO-2035 needs another feature, but it's missing: it should skip over empty channels automatically. Although the PRO-2035 scans twice as fast as the PRO-2006, it still wastes time scanning empty channels unless they are locked out. The bulk move operations listed above clear the lockout on each destination channel. Owners will certainly grow weary of pressing the LOCKOUT and MANUAL keys for each empty channel.
There are 10 banks of 100 channels each. Bank 1 is for channels 1-100, bank 2 for 102-200, and so forth. This is more difficult to use than the numbering convention employed in the Icom R-7100, where bank 0 is for channels

0-99, bank 1 for channels 100-199, etc. With Icom's numbering system, you can easily tell what bank a channel is in by its first digit, e.g., that channel 650 is in bank 6. In the PRO-2035, channel 650 is in bank 7, and that's confusing. All that aside, a better scheme would be to have more banks and fewer channels per bank, say 50 banks of 20 channels, or even user definable banks, because a bank of 100 channels is really too large for sensible programming.

Almost 20 years ago, the Electra/Bearcat BC-250 incorporated a fantastic new feature termed "search and store." One could program a pair of frequency limits, start an automatic search, and store all active frequencies into a special scratchpad memory. The active frequencies could later be recalled and programmed into regular memory channels. Electra's scheme was elegant -- smart enough to store each active frequency once and only once. What's more, one could store unwanted frequencies, e.g., birdies and paging frequencies, into the scratchpad and they would be skipped during conventional searches. Today's Icom R-7100 receiver boasts a similar feature.

Scanner hobbyists were hoping Radio Shack would offer a search and store feature in its next premium scanner, and it did -- sort of. The PRO-2035 has an Auto Store mode which stores active frequencies found during a search into one or more conventional memory banks. Once all the empty channels are filled, the PRO-2035 emits a series of beeps and stops searching. There is a separate pair of frequency limits for Auto Store so you won't use up one of the 10 pairs mentioned earlier.

What a pity the Auto Store implementation is not all it could be. You cannot use it to skip unwanted frequencies. Worse, it will store the same frequencies over and over again into empty memory channels. Let's say you program the PRO-2035 auto store limits to search between 407 and 419 MHz, and specify that active frequencies will be stored in bank 4. You start the search and let it run while you run some errands, hoping that while you are away, the PRO-2035 will be catching dozens of interesting federal frequencies.

Upon returning, you find the PRO-2035 snared a busy Veteran's Administration hospital paging system and stored the same frequency in 30 channels! That's just what happened during the evaluation. Even with its limitations, the Auto Store mode is beneficial and a few new frequencies were found while using it.

Here's a tip not mentioned in the owner's manual -- you can use the Auto Store mode to intentionally store the same frequency in several channels. Set both the lower and upper auto store limits to be the same frequency, open the

squelch, and start the auto store search. The PRO-2035 will chug along, storing your favorite police or other frequency in all the channels in the banks you selected. The tests which follow were performed by switching an outdoor Antenna Specialists AV-801 antenna back and forth between a PRO-2006 and the PRO-2035.

Sensitivity

Spot checks were made to compare sensitivity by listening to the same weak signals on both scanners. Both radios were similarly sensitive except in three instances: the PRO-2035 was slightly more sensitive at 147 and 852 MHz and noticeable more sensitive at 460 MHz.
This could be splitting hairs, as my 10 year old Electra/Bearcat BC-300, an old design optimized for 4 bands, beat both Radio Shack models in the sensitivity department.

Dynamic Range

The PRO-2035 and PRO-2006 are high end models, and people who buy them are more apt to connect them to outdoor antennas. Therefore, it's important that they perform well in strong signal environments.
Perhaps the biggest performance difference between the PRO-2006 and our PRO-2035 became apparent when listening to weak signals in the presence of a strong station transmitting on another frequency. The PRO-2006 has much better dynamic range than the reviewer's PRO-2035. Using the PRO-2035, a moderately strong signal from the 460.525 MHz sheriff's repeater 10 miles distant wiped out weaker signals on frequencies 50 kHz in either direction and produced hiss on weak signals 100 kHz away. The desense phenomenon was a problem in the 155 MHz band, too. The PRO-2006 was not affected by these signals.
To explore the problem further, the PRO-2006 was replaced with a PRO-2005 and the tests run again. Neither the PRO-2005 nor PRO-2006 were desensitized by the moderately strong signals.

Images and Spurious Responses

The PRO-2004/5/6 series, the portable PRO-43, and the PRO-2035 use "up conversion," but the PRO-2035's 609.005 - 613.5 MHz first IF (intermediate frequency) is 2 MHz higher than the earlier models. We speculate the change was made to avoid interference problems which bothered some owners of the earlier scanners who lived near a channel 20 television transmitter. The TV signal mixes with one of the local oscillators and generated a third signal near 48.5 MHz, the 2nd IF, causing interference on

several frequencies.
Although up conversion affords improved image rejection, triple conversion and frequency synthesis circuitry are complicated and several images were heard, especially on the PRO-2035.
On both the PRO-2006 and PRO-2035, images of paging transmitters were audible in the 159 - 162 MHz range. Analysis shows these signals to be 771.9975 MHz higher than the displayed frequency. For example, the 931.5125 MHz KOR933 paging transmitter, located more than 7 miles away, was heard when the PRO-2035 was tuned to 159.515 MHz.
A paging image hindered reception of a sheriff's repeater in the next county on 159.15 MHz. The same paging images were present but barely detectable on the PRO-2006.
Another image, heard only by the PRO-2035, appeared on 146.075 MHz, and it was actually a 904.075 MHz data transmission.
The PRO-2035 received cellular phone images, reduced in strength, between 1105 and 1115 MHz. The difference between the actual and displayed frequencies varied:

PRO-2035 tuned to (Image)	Actual transmitted frequency (Actual)	Difference (Actual - Image)
1105.550	870.450	235.100
1107.875	876.120	231.755
1110.900	881.100	229.800
1113.470	886.530	226.940
1114.840	893.160	221.680

New Features

The new tuning knob has a light feel but is a welcome feature nonetheless. A look inside the PRO-2035 revealed the tuning knob is connected to a special switch assembly rather than an optical chopper, or photo interrupter, used in higher price radios and computer mice.
The knob can be operated as a channel selector or as a VFO control. We discovered a technique, not mentioned in the owner's manual, which let's one enter a frequency and tune around without actually storing the frequency. To tune around 154.6 MHz, for example,

1) press MANUAL (if not already in the manual mode)
2) press 154.6
3) press TUNE
4) rotate the knob in either direction to begin tuning

If you have never used a scanner with a tuning knob, you will be pleasantly surprised how handy it is to be able

to tune around using a knob instead of fighting with the up and down keys on the PRO-2006.
While putting the PRO-2035 through its paces, the tuning knob was used in the VFO mode to chase down and identify a spurious paging signal, a "spur," which was drifting up and down the 2 meter ham band. The spur caused a serious interference problem to three area repeaters. Chasing a wandering spur requires the use of a tuning knob and the PRO-2035 served well. The PRO-2006 was virtually useless in this application.

Other Considerations

The PRO-2035 specifications state 50 channels per second as the fastest scanning speed. Our PRO-2035 scanned slightly faster than 50 channels per second in a bank loaded entirely with 800 MHz NFM frequencies, and slowed to 40 channels per second in a bank purposely loaded with a mixture of frequencies in different bands and modes.
Some scanner buffs refuse to use the priority feature on their radios because priority sampling tends to "chop up" transmissions on nonpriority channels. The priority feature in the PRO-2035 is well behaved in this regard, and one can hardly tell it's enabled.
While the squelch on the reviewer's PRO-2035 had an acceptable amount of hysteresis, some users may wish to reduce it. That is, decrease the amount of "play" in the squelch control. One could lessen the hysteresis by replacing the tiny 100 Kohm surface mount resistor between pins 12 and 14 of IC-2, a TK10420, with a 220K or 330K ohm resistor.
Wine gets better with age. That's not true with the EL (electroluminescent) panel used to backlight the displays in the PRO-2004, PRO-2005, and PRO-2006. The EL panel grows dim as it is used. To prolong its life, GRE replaced the dimmer switch in later production PRO-2006s with a switch used to turn off the back light.
Instead of an EL panel, the new PRO-2035 utilizes LEDs (light emitting diodes) to illuminate the display, and that's an improvement. Unless overdriven, LEDs will work reliably for a very long time.

Summary

Being at the top of the Radio Shack scanner line, we expect a lot from from the PRO-2035. Its tuning knob and memory manipulation features are significant advantages over the PRO-2006. The discontinued PRO-2006 exhibited better dynamic range and fewer images and remains an excellent performer.
The PRO-2035 is a very good scanner. With a few

changes, it could be a great scanner.
After this review was written, Uniden introduced the BC9000XLT top line base model, which the author tested and prefers to the PRO-2035. See the BC9000XLT review in Monitoring Times, March 1995 for more information.

Addendum to:
The Radio Shack PRO-2035 Scanner:
How Does It Compare With the PRO-2006?

Copyright 1994 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

I compared the new 1000 channel Radio Shack PRO-2035 scanner with the discontinued PRO-2006 in my Jan. 1995 Monitoring Times Scanner Equipment Column.

Unfortunately, the article was too long to fit within the 1600 - 1800 word limit so some parts had to be cut (with my ok).

Here are the parts which do not appear in MT. The full length article is not currently available on line.

The PRO-2035 analyzed in the review was purchased from a local Radio Shack store and bears a serial number near 3000.

Here's a tip not mentioned in the owner's manual -- you can use the Auto Store mode to intentionally store the same

frequency in several channels. Set both the lower and upper auto store limits to be the same frequency, open the squelch, and start the auto store search. The PRO-2035 will chug along, storing your favorite police or other frequency in all the channels in the banks you selected.

Although up conversion affords improved image rejection, triple conversion and frequency synthesis circuitry are complicated and several images were heard, especially on the PRO-2035.

On both the PRO-2006 and PRO-2035, images of paging transmitters were audible in the 159 - 162 MHz range. Analysis shows these signals to be 771.9975 MHz higher than the displayed frequency. For example, the 931.5125 MHz KOR933 paging transmitter, located more than 7 miles away, was heard when the PRO-2035 was tuned to 159.515 MHz.

A paging image hindered reception of a sheriff's repeater in the next county on 159.15 MHz. The same paging images were present but barely detectable on the PRO-2006. Another image, heard only by the PRO-2035, appeared on 146.075 MHz, and it was actually a 904.075 MHz data transmission.

The PRO-2035 received cellular phone images, reduced in strength, between 1105 and 1115 MHz. The difference between the actual and displayed frequencies varied:

I just purchased a motorola flip phone, and the operating instructions specifically state DO NOT CHARGE BATTERY MORE THAN 24 HOURS.
Based on this I'd venture to guess you fried the battery, as most newer cars have a hot lighter (meaning the key does not have to be on to use it).

If I remember correctly, the button battery is on the left side of the
main board close to the transformer.

> 467.6875, 467.7125

Not quite. Those are the freqs designated for FRS. However, the RS model only has the lower 7 of these 14. Also, there is not a channel selector knob. For all intents and purposes, it is a 1 channel radio, but that one channel can be changed by removing the battery pack and selecting the frequency with dip switches. I'm not impressed by it, and few people who have discussed it here in the past have has much good to say about it.

Last time I checked, they weren't in the stores yet. Have they arrived?

What's in front of your roof? Larger buildings or what?

Major trees with spikes in them from Friends of the Earth
will hinder reception.....

What does the eye see when looking from your roof?

Then this may help. I have a discone on my roof and
i get up to 100 miles away....over hills and dales
and puppy dog trails....

I own an EXP9100 and I think it's about as secure as your going to
get. The signal is extremely wide so a normal scanner is unable to
hear it.

My understanding of scanners in cars is that if you have a ham
license, the FEDS say you can have a mobile scanner. I carry a letter
stating that. I believe I got it from ARRL.

see http://www.primenet.com/~baron/aorintfc.html. I did the mod for the AR 2700 to get myself a Scout serial port and built the MAX232-based level convertor to get it connected to the PC. Supposedly, the AR8000 has the same serial interface as the 2700. See WJE's homepage (http://www.mv.com/users/wje/aor.html) for 2700 as you will also find there the 8000 pinouts (the Scout jack mod makes it easier to get to the serial lines--if you use the standard jack inside the battery compartment to get at it, you will need to make-up a flat flex cable--his page has thast info as well.

Good luck!

It has happened to me twice, two years apart, in the same
store (some of us are slow learners), with the same manager:

Has anyone heard any support comms in the ham bands? I did a quick pass through 2m, 220 & 440 and didn't hear anything (though it's entirely conceivable they're on simplex). I got a little curious when I heard a representative for Malibu saying something like "We really don't know what the current status is for some of the shelters - our cable went out a few minutes ago" 8*(8*(

Neither will help. You have a failed buss on the keypad pcb. Either
a cracked trace or bad connector. Find the trace that is common to
those 3 pads and start tracing it with a continuity tester. The
problem should show up rather quickly.

Now that we've established what these are, I wonder....

Is what these stores are doing the same as if a scanner buff pulled a
cordless phone transmission and re-broadcast on a baby monitor? And
without the callers' knowledge?

If it were a scanner buff, I suspect someone would be getting their
undies in a knot.

Is what these stores are doing legal???

This antenna will be no better than the whip down around CB land, but
should be MUCH better around 150M.

>the little whip antenna mounted on the case. I checked that the cone is
>grounded OK and that the disc is not shorted to ground. The discone is
>connected via 75' of RG58 cable; would RG8 improve performance much?

At this length, RG6 would be in order (at a minimum) with good
connectors, attached well.

>Also, there is a large VHF/UHF TV antenna mounted on the same mast as the
>discone, but about 3' lower. The TV antenna is not connected to anything

The TV antenna and mast will both affect performance, regardless of
any connections. They cause lobing of the recieve pattern.

>at the moment, but could it be shielding the discone? Would a pre-amp
>help, and if so, would a mast-mounted pre-amp be necessary or would an
>indoor type do? Any advice appreciated.

The only reason to use a pre-amp is if you are many miles from any
transmitters. Your problem could in fact be one of saturation. The
radio is recieving such strong signals from the discone that its
performance actually diminishes. Try switching the attenuator (on
rear of unit) in while listening to a known signal and see what
happens.

From: topper@microagewny.com
Message-ID: <54hd0o$ou1@mawny.microagewny.com>
Source record: 219665

I am looking for plans / schematics for building a "tone grabber" or a Scout scanner. They are 2 different devices.

Ramsey makes a kit for a tone grabber that runs for about 100 bux, a full assembled unit runs 150 bux, I think you can make a tone grabber for about 15 bux or less and was wondering if anyone bought one of these in that past and can copy or fax the plans to me.

I am looking to buy either device used if anyone out there wants to get rid of there unit.

I think it would be too complecated to build a scout scanner on my own but if anyone knows of a unit like a scout that could be built please let me know.

Thank you.

Topper@microagewny.com

Your enter and clear probably don't work, either. What you have done is one of two things.

1. Done the cell mod and moved diodes around then created a short (bypassing the diode).

2. Broke a PCB trace in the diode matrix section while doing the cell mod.

******Fix

Examine your scanner closely. Particularly in the diode matrix where cell mods are done. Check to see if there are any solder bridges. Remove them if apparent.

Check to see if you broke a PCB trace...this usually happens when doing the cheeseball cell mod without removing the shield and using an x-acto knife.

This will have to be fixed by running a small wire jumper from each of the broken points and soldering them down. Check the area where the silk screening is apparent...there are usually some lines hidden under them.

I have fixed 8 Pro-43s from this malady.

Good luck,

Dave
(Scanner Flatulaire)

I have bought 2 Pro-43s from local RS both at $40 each!!! Brand spanking new and cell capable other than repaired broken traces. Great scanners.

I've had a Yaesu FT50R for about four weeks now, and have found nothing comparable to it for both scanning and for transmitting dual-band as a ham. It's much less expensive than many of the scanners on the market, and has the added bonus of being a transmitter as well. I highly recommend it. I bought mine at Ham Radio Outlet.

PC> naturally) direct their criticisms towards more visible targets.

Radio Shack has the skinflintiest attitude of any company I
know of. They're still pulling that trademark tactic of theirs
of manufacturing and selling products that are incompatible
with products of other manufacturers. Today I needed a 1/8"
stereo-to-mono plug adapter to use on a Sony headset for a
Pro-29 scanner. When I tried the adapter, the volume coming
through the earpieces was drastically lower than normal, as
though something inside the adapter was broken and nulling the
connection. The guy at RS told me that there's one millimetre
difference in the length of Sony plugs and RS ones. Just
enough to make the two brands incompatible and forcing you
to buy an RS headset for the RS plug. He wouldn't even take
the plug back after that, and it was already opened and stapled
shut when he had sold it to me. They've made their fortune with a
nickel-and-dime attitude like that. It's almost a disgrace for
a corporation their size to cultivate that kind of image.

sid@commcen.demon.co.uk (Sid James) writes:

> I have been collecting a large amount of data and now want it
> presented in a particular order.
> I have tried word6 and it says the file is too large to cope with
> Would anyone have a sort utility of some description.

I assume that you are running MS-DOS. If so, the SORT
utility should be able to sort your data. For instructions
on how to use SORT, type "HELP SORT" at the "C:>" prompt.

If you are running MS-DOS version 5 or lower, you can also
find complete documentation in the User's Guide that came
with MS-DOS. If you have MS-DOS version 6.0 or higher,
you will have to purchase the MS-DOS Technical Reference
manual to get the same information. See the order form
in the back of your User's Guide for more information.

There is one limitation listed in the documentation: SORT
is limited to a file size of 64K. If your file is larger
than 64K, you will have to split your file into multiple
files, sort them, split them again, combine all the
first halves into one file and the last halves into another
file, sort these two files, etc. It is a simple process
once you get the hang of it. A clever person could write
a program or even a batch job to automate it, but for a
one-shot job it probably isn't worth it.

> 73 de Dave, NF2G

I think there is some confusion about a scanner and an amateur radio transceiver capable of receiving out of band. I contacted the ARRL about this issue a year ago and what I received basically told me that hams could not be busted for having an amateur radio transceiver capable of receiving signals outside of the amateur bands (i.e. police freqs.).

The guy at the ARRL told me that even if police frequencies are programmed into your amateur receiver, you cannot be busted. However until the League agrees to reimburse me for my legal expenses should I be caught with police frequencies programmed into my Alinco, I won't be testing that theory any time soon.

Let me state this for the record. An amateur radio license DOES NOT give you the right to carry a scanner in your car in New York State. Heck, I'm also a volunteer firefighter and that doesn't give me the right to have a scanner in my car.

As the editor of a hobby related publication (National Scanning) I know that rumors can easily be started about a magazine and they are hard to refute. However, Bill Cheek is right. US Scanner News has not paid its writers for a year although supposedly they promise to do so by January. Funny that a guy who could afford to take over the balance of RCMA's unexpired subscriptions couldn't afford to pay his writers.

As far as PopComm goes I have heard the rumors although one of their writers did tell me he hadn't been paid for almost a year.

Hopefully with the new generation of scanners coming out there will be some exitement in the hobby.

Source record: 219426

I'm in need of info about connecting an external antenna to a Realistic Pro-2006. Specifically, I'm curious what coaxial cable to use between the unit and the antenna. The manual recommends RG-8. I've also heard that Belden-9913 is great.

My understanding is that I should use a 50ohm cable such as RG-8. But if quad shielded RG-6 cable is just as good, I'd like to know that.

And regarding the Belden 9913 coax. It's a much larger copper core (11AWG I believe). How do I get that wire connected to the BNC connector on the 2006?

Any help is appreciated. Probably best to Email me.

Have a approx 5 year old BC200XLT. Wasn't using it much so the battery pack ran down. Now that I have put in a freshly charged pack, the unit won't put out any audio, and seems to be insensitive to the squelch. It programs ok. By insensitive,I mean that no matter where the squelch is set it keeps scanning. Took the battery pack out overnight, and it still has the same freq's in it and same behaviour. I have had it apart looking for some sort of CPU reset line, but no luck so far. Naturally I have misplaced my manual, not that I recall there being much in the later books. I have made the battery life mod in (can't remember the name)'s book.

Any suggestions?

Naturally this came up during the Calabasas fires, which are darn close to me.

Bob R

Any particular areas of interest? Scanner Master just released a new edition of Massachusetts which you might enjoy. 800-722-6701 or e-mail ScanMaster@AOL.com.

I don't work for them, I just know it came out in the last couple of weeks with some nice updates.

2082. Weird Reception of LAPD Frequencies

Newsgroup: rec.radio.scanner
Date: 1996-10-23 00:00:00 UTC
From: bonehead823@netcom.com
Message-ID: <326EA313.1FC7@netcom.com>
Source record: 219434
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've noticed that whenever I'm listening to LAPD frequencies from my area (a tad away from their location), REGARDLESS of what scanner I'm using, its antenna, or my location (as long as I'm an acceptable distance AWAY from their coverage area), LAPD frequencies seem to have a weird "phase-in, phase-out, phase-in, phase-out" effect on their actual carrier signals. Its as if the operator of any given frequency is turning a variable repeater TX power dial between 100 watts and 10 watts, 100 watts and 10 watts, etc. I guess the best way I can explain it is to give you all an illustration, as dumb as this will be. :) Picture this as a heart monitor-like graph of the carrier "strength" over the duration of one second showing, which is respectively showing the signal strength:

```
Full scale: --------. .--------. .--------. .---------
Average: ` .` `. .` `. .`
Poor: . . .
```

As you can see, or maybe not, the signal drops to a hissy level about three times a second at exact intervals, and then back up to full scale again. What could be causing this? Depending on the frequency I'm listening to, the interval is either faster or slower. And like I said, it happens regardless of what scanner I'm using, whether I'm on the east side of town or the west side of town, etc. I was thinking that it may be a side-effect of out of phase co-phased antennas, but I'd be apt to think that hetrodyne would be in order in such a case, not this. But then again, maybe this is a result of being **SLIGHTLY** out of phase? Someone help. I'm beggin' ya. I was put on this very earth to find out the cause of this exact phenomenon, at this exact point in time. Thank you all for your undivided attention. And I'll leave the light on for 'ya. Bye now! Yeah, yeah, yeah .. ..

>programs ok....

That's indicative of a defective PNP surface mount
transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to
furnish 8 VDC to several stages of the BC200XLT.

Q201 is located on the foil side of the "Micom" board,
adjacent to the black multi-pin connector which mates the Micom
and main boards together.

Q201 can be destroyed by a few different causes, primarily,
by something in the scanner drawing too much current through
it. In one case, capacitor C36 shorted. It's a 220 uF 10v
electrolytic, located on the component side of the main board,
connected from pin 8 of the audio IC (IC2 NJM386SL) to ground.

In a pinch you bypass Q201 by soldering
a short piece of bare wire between the collector and emitter.
Appears that Q201's main purpose in life is to switch
off power hungry stages of the BC200XLT when the CPU thinks
the NiCd voltage has fallen below a threshhold. That's an
attempt to limit the current drain on weak NiCds to avoid
permanent damage.

Another indication that Q201 went "west" is that in addition
to the behavior you described (BC200XLT scans, but no signals,
audio or white noise), the backlight lamp fails to light.

Hi Larry,

The answer to your question is going to vary depending on the freq you want to monitor. The original PRO-43 antenna is lacking in certain bands but good in others. Finding a duck that does it all might not be possible.

I replaced my 43's duck with the duck from my 200XLT. I find it works better overall for the freq's I monitor. But before you set your sights on any new antennas, I have one suggestion.

Don't overlook the Shack's collapsible center-loaded 20-006 antenna. It is an excellent choice, I've used one since late '88 when it first came out. You can "tune" it to the band you wish to monitor and it will cost a lot less than buying a new duck. It may be the best scanner antenna readily available. I'll talk more about it later.

(Previously RS offered a 32" collapsible antenna, 20-008, but they dis-continued it. I have one and it works very well, better performance on low band)

If you really want a collection of ducks, I would recommend the Centurion line of antennas. a couple of years back they would sell direct to an individual like you and me but they've stopped the practice.

However, you can look for a distributor in your area. You can use the phone book or Alta Vista on your computer. Search under two-way radios, radios, antennas, etc... you'll narrow it down pretty easy.

You might wish to call Centurion and ask them for a catalog and the name of the distributor nearest to you. The number is 1-800-228-4563.

I'll list the Centurion antennas I use. If you have any questions, E-mail me and I can get into more detail, I have their latest catalog.

The best low band antenna is their EXL model. It covers 30-50MHz and is available in bands of 30-36, 36-42, 42-50MHz. It is a bit long at 11".

The best dual band they offer for VHF/UHF is the EXY model. It covers the 140-174 and 400-512 bands. It's about 6" length but can be reduced to 5 1/4" by trimming the PVC jacket. I find it better than the RS 43 antenna but still find my 200XLT antenna more useful for the bands I monitor.

They offer numerous VHF style antennas. I've had a couple "cut" to specific freq's and they seem to perform well. I believe it's the EXS line that you'd want, about 3 1/2" long and they offer a fully jacketed antenna, i.e., the metal BNC connector is also covered by the rubber jacket. It looks neater and fits snugly on your scanner.

A UHF model I like is the Style G model. It's a 1/2 wave and offers 2.5db gain over a standard 1/4 wave antenna. It's base loaded and is about 13" long. If that's too long they also offer a 1/4 wave model called the EXC. I have one cut to a local user, very low power, simplex and it really pulls in the signal better than any of my other antennas. About 6" long.

The best antenna overall for my PRO-43 is the EXG which covers the 806-960MHz band. It offers 3.0db gain in a 5/8 wave design, base loaded. Anyone who owns a 200XLT knows that it's a brick when it comes to monitoring the 800 trunk band or anything in the 806-960 band. This antenna really helps the 200XLT hear, that's pretty good. It measures 8", it's a very good antenna.

One advantage to the EXG is that it attenuate's the VHF band somewhat. But I find that that's perfect on my PRO-43 which is intermod prone in the VHF band where it's much more sensitive than the 200XLT. This allows me to use it when I'm in a high RF area, especially near pager sites, which are everywhere. I tend to use this on my PR0-43 most of the time.

If you want a duck and want only one, the EXG is it. If you want several I'd order a Centurion. They cost $18-24 each. You can also find ducks at flea markets. But you'll have better success in ordering a duck cut to the particular freq or band you want to monitor.

BTW, an antenna cut to a particular band works very well on a frequency counter by helping it become more sensitive to the band you want to capture a signal from. You can use an antenna this way to attenuate unwanted signals to a degree.

My Interceptor also likes tuned antennas which help make it less sensitive to TV and radio station RF. Both tuned antennas and a Jim-75 or Jim-51 pre amp can do wonders to improve signal capture.

Perhaps the best replacement duck is the GRE All-Band antenna, I believe this is the one that came with the PRO-34. A knowledgeable friend states that it is the best of the OEM antennas. He's tested numerous antennas on lab equipment and likes this one.

Larsen also has antennas available but I've never used any of them. Maybe someone will post info on their line.

Another popular antenna is the Austin Condor. It's been around for a while and some people feel it makes for a good low band antenna. It's 12" tall and costs about $29.95 in most catalogs. Grove (MT publisher) carries this antenna, 1-800-438-8155 for orders only.

I have heard about a new Austin antenna called the Seeker 800. It's suppose to cover the 850-900MHz band quite well. It's available from Radio Ware 1-800-950-WARE. I've never used this particular model so call for more info if you're interested in it.

Keep in mind that an antenna can be very useful on more than one band. An example would be the Diamond RH-205 a 2 meter 5/8 wave antenna. It would be a 3/4 wave antenna in the 150 band and a 1/4 wave antenna for the 46MHz

band.

The Diamond RH-77 (B or CA) would be a very good general purpose antenna, not to long, light and flexible.

20-006 tuning:

Tuning the 20-006 is simply a matter of experimenting with the antenna by collapsing various sections. Here's one way I found to make it work better on low band and VHF high.

The antenna consists of 5 sections on top of a center loading coil and then 4 more sections under the coil. Section 1 is the top element and #9 is the bottom one for this discourse.

Try to find a low band signal like the local fire channel or your own cordless phone. Extend the antenna and then collapse only the top 2 sections. You'll have to experiment a bit to see where you find your best gains.

Perhaps you'll need to push in the 3rd section half way, it'll depend on the freq involved. I could hear more cordless activity when I used the antenna this way, at least when it was legal to monitor cordless.

The VHF can be helped the same way. But this time you need to collapse elements 4 and 5 down to the coil's top. I find it helps get the best VHF signal in the federal band. Experiment on your own to see where you get best results. The 20-006 only costs $9.95.

I can't explain why the antenna works like it does, we'll leave that for the more technical people in this newsgroup. I did however write to Radio Shack about it and one of the engineers responded. But he only offered the info that it was designed using usual antenna theory and spectrum analyzer procedures.

It's a favorite when I have the room for it in my gear bag. At the price RS sells it for, it's a steal. I hope some of the above info helps you choose a replacement antenna.

Regards,
Lou Shirley

Joe wrote:<<Hopefully with the new generation of scanners coming out there will be some exitement in the hobby.>>

Well, I hope so!!! Even with what is on the market, there is pleanty to be excited about. We now have scanners with alpha programming (although it's only the first 250 out of 500 channels), we have scanners that can be computer controlled, we can decode ACARS, we can fins unknown frequencies just by standing in the vicinity with a gizmo called a scout.

Sure, some will say the internet is killing the publishing business. I will admit, yes it may change how we have to do business, but you still can't take your PC to the crapper with you and read like you can with US Scanner News, PopCom, NatScan & MT. And, ummmm in an extream emergency the type of paper that NatScan & MT use may be soft enough if you run out of Charmin.

I really feel that the publications that are up against hard times can like most businesses that tread rocky water blame it on mis-management.

A 12 volt supply works fine... so does the 13.8 or so you get from the cig lighter in your car when the engine is running. (Automotive DC is pretty harsh.. spikes, poor regulation, etc.) 12V from a lead acid battery in the home works fine... just as anything from about 11.5V up to about 14 to 15V or so out of a DC power supply.

Unless you have a good reason to do away with the AC, I can see no benefit to doing so. The unit is designed with it's own power supply, with sufficient regulation and filtering to power the unit with plenty to spare. If you do see a substantial improvement in performance by going DC, then you may have a slight problem with either regulation or filtering in your internal supply.

On the other hand, if you are trying to run off of solar, battery, generator, car, boat, or other DC source because there is no AC, or AC is inconvenient then that is a different story.

In the manual you will find the limits of acceptable input voltages to the DC input jack, with it's respective current requirements.

I do know, however, that it will run fine on 12 volts. No degredation in performance or volume whatsoever.

Dan

The display unit would have to be intelligent, from what I've been reading. Basically do what a PC would do ... take the place of the display already on the scanner. The PC interface accepts commands (abbreviated) to duplicate the commands available on the keypad. Also, a few extra commands may be available to upload/download the eprom, etc.

My friend was able to get a Comspec DPL board in his Kenwood 741 but
encode only.
The problem is dual mode operations where the dpl board and the pl board
are both putting out pl's at the same time. This will not allow you
into some repeaters or not open some squelched rigs. You need a way to
shut the board off. Comspec is not a plug & play board. You need to
install it and it comes with general directions. Also dpl is set with
dip switches I believe and therefore you can't easily switch tones...
That'll be $65. please. Ha.. just kidding.

Could be an effect of a simulcast signal with one of the xmitters being
unstalble and drifting during the transmission. This could explain why
it is cyclic based on the period of the drift...

Just a thought...MikeN

Anyone have any mods for the Icom IC-W2A dual-band handheld that will allow it to transmit all the way from VHF to UHF (and perhaps even to 800)? Or even the command keystrokes to allow monitoring of 800MHz and up?

Please e-mail to joshua@iag.net. Much thanks!

Joshua

I built one; it works fine.
You assemble a bridge rectifier to drive the 741, that derives its inputs from RTS and DTR, which are pins 4 and 20 respectively on a DB25. Ground is 7.

I just bought one of their softpacks ($9.99 cheepo) for a scanner and
when I ask the salesman if he had any in stock he went back and got one.
After ringing it up I noticed that it was a return and it was stapled
shut with a business card turned backwards and the catalog number was
wrote on it. I took it but if it had of been a piece of electronic
equipment I would have told him to stick it. If something is returned
they box it up and stick it right back on the shelf. Man I wish Walmart
would start stocking conectors, resitors, and capacitors........then the
Shack would be gone!

It should be noted that refers to U.S. federal law. Here in Canada, we are able to monitor any radio signal, including cellular and portables. It only becomes illegal if you use what you're heard for personal gain or tell others what you have heard.

I'm on the flatland here, but there are, I believe, multiple transmitters and antennas. Someone else suggested
that the problem could be that these xmtrs are slightly off frequency from one another. For some reason it only
seems to occur on one freq, however, not on other freqs of the same department which presumably, broadcast from
the same sites.

Thanks for the information.

2108. COM203 (by Commtel)

Newsgroup: rec.radio.scanner

From: jstuyven@xs4all.nl
Message-ID: <54irqe$998@news.xs4all.nl>
Source record: 219509

Hello,

<Sorry if this question was posed here before; I'm new to this newsgroup. I also posted it in alt.radio.scanner.>

At Javiation's page (http://www.demon.co.uk/javiation/pro43.html) I discovered that the PRO-43 will be named COM204 from now on. Is there also an original or ancient name for my COM203? Its specifications are more or less similar. These are a.o.:

200 channels
68-88, 108-174, 380-512 and 806-960 MHz
Lockout, Delay, Priority channel, 10 monitor channels
Search up/downward within predefined limit frequencies
etc.

I bought this scanner a few weeks ago, and didn't have anything but fun with it. Except that entering 200 frequencies by hand is a bit exhausting :-)

Is there anyone that owns this scanner? I'd like to hear your experience, comments, hints, etc. Make sure you got the type number right: I'm talking about the Commtel COM203, not the 204.

Best wishes, and thanks in advance,

Joost van Stuyvenberg

[snip]
>As for Wayne Greene, has a new issue of 73 magazine come out in the last
>month? The most recent one around here was the September issue. Of

The report was that "Wayne Greene, Inc" had filed for bankruptcy <sp>,
but that "73" was not a part of it. WGI evidently, encompassed a computer
magazine, a CD music magazine and (maybe?) his cold-fusion newsletter.
So, supposedly, 73 will continue, but I have noticed it is getting
smaller each month. Of course, Wayne should have a bundle in the bank from
the sale of all of his empire to IDG in the mid-1980s. He supposedly got
between $15 - $60 million in that deal.

>course, over the last few months I've been rather amused with some of the
>content of the magazine, such as a review of a book that claims the moon
>landings were faked, or the article in the Sept. issue that mentioned

Of course, with the "moon landings faked" story he was copying the gone
but not forgotten Midnight Man of WWCR, William Cooper (up until recently,
on WWCR 5065 Khz from Midnight to 1AM, Eastern). Cooper claims we got
advanced technology from aliens back in the 1930s, but for some reason
faked the moon landings (something about all of the original astronauts
being Masons :-).

>so-called "zero point" energy devices. The fringe science stuff I'm sure
>has turned off some readers.

Yep, Wayne is knee-deep into the "cold fusion is real" movement, and has
been publishing a newsletter on it (although that may have collapsed with

the bankruptcy).

73 is still a good magazine, and I hope Green is able to keep it going.

2110. Newbie question from Nevada County, CA USA

Newsgroup: rec.radio.scanner
Date: 1996-10-23 00:00:00 UTC
From: Nathaniel Ingersoll <ni@networth.com>
Message-ID: <326D667D.6C4C@networth.com>
Source record: 219511

Hello all,

I'm new to this scanner stuff and eager to learn more. I just got a scanner, primarily to keep track of fires around here (anyone heard of the 'forty-niner fire?), and so I'm trying to digest the "POLICE CALL plus..." book of frequencies.

Can anyone out there give me some pointers on what to look for, and if anyone out there lives in Nevada County CA (I'm in the GV/NC area), do you have an interesting-frequencies list?

A more general scanners question is, I got a hand-held unit (Radio Shack PRO-29 60-channel) which I acquired when I had absolutely zero knowledge about this subject (and now, 18 hours later, I have just barely more to go on), but I now realize that there are three gazillion frequencies, and I'm wondering if 60 is going to be anywhere near enough - opinions? Price isn't really an issue.

The High Energy Transient Experiment (HETE) Spacecraft is currently scheduled for launch on October 29, 1996 from Wallops Island on a Pegasus rocket. Our low rate VHF (137.96 MHz) data transmitter on board may be of interest to radio hobbyists. This data stream will be used for spacecraft status messages and to notify astronomical observers of gamma ray burst positions in real time. This data may be received with relatively simple equipment.

The planned orbit is ~540 km altitude, 38 degrees inclination. The other elements depend on the launch date and time. The first northgoing equator crossing should occur at around 164 degrees east longitude on the Earth, about 4300 seconds after the release of Pegasus from the launch aircraft (nominally 1700 UT).

VHF signals will be weak for the first few hours, as the VHF antenna is stowed with the solar panels, which will not release until we have adequate control of spacecraft angular momentum.

For information on receiving the VHF data, visit:

http://space.mit.edu/HETE/VHFlistening.html

For general information on HETE, visit:

http://space.mit.edu/HETE/

It's a concrete fact that USSN has not paid its writers in months. It is a well-known fact, too......no conjecture or suppposing about it. I know several of the writers.....

Not only that, but Popular Communications has owed some of its writers for a year or so. It is a common thing to pork the writers when a magazine is on its last breath. It goes with the turf.....

Garry, I'd bought one of these "on sale" a few months ago, and used it for a day, then returned it. 2 reasons. First the auto store function is useless. It will scan and store active channels, which is nice, however, it doesn't discriminate between new frequencies and ones that it's already stored. So conceivably, it could store the same frequency hundreds of times. Second, it has too many channels per memory bank to really be useful.

BTW, I now have a PRO-2045 in which the autostore function stores only new frequencies, and the scanner also has a more manageble memory bank arrangement.

Sorry for the negative critique. If I were you, I'd return the scanner and pick up a 2042 or 2045.

Regards, Barry, WA2KLS

Brian,

I have a pro-43 and it's most common problem is the keypads!!
Instead of ordering just one, do yourself a huge favor and get two.
If you use it 1/2 as much as I do, you'll be needing them. The R&R isn't
that hard, just take your time in a nice quiet place.
Good luck,
Chris Nelson

Actually what most microprocessor circuits did in this situation was to use a large (~ 1 Farad or greater) capacitor to store the energy for the memory backup. That's how my old PRO-34 worked.

Incidentally I read a post a while back about someone having trouble listening with a discone antenna. The most likely problem is a bad connection at one end of the coax or the other. i.e. a multimeter is a worthless instrument for checking a coax cable. Good dc continuity does not equal good rf continuity. If you installed a connector yourself, there is a 99.999999% probability you did a lousy job. That's why my company hires people whose only job in life is to install RF connectors on cables.

Jerry Stack (jps@pacbell.net) wrote:
: In listening to the local L.A. Co. Sherriff's frequency, I have noticed a
: kind of "chuffing"sound on transmissions by the dispatcher. It has a
: regular rhythm. There is no similar sound coming from the mobile units.
: The frequency is in the 480 mhz range. Other transmissions in this
: spectrum don't have the strange sound.

: I've noticed this on several scanners. Anyone have an idea what causes
: this?

Is this area around hilly terrain? Possibly could be a "loss of
phase". Perhaps..... only perhaps, that agency could be using more than
one transmitter antenna. Those multiple antennas could be slightly "out
of phase" with one another. There may be a slight transmission delay
between antenna sites which could cause this sound.
Sometimes around hills or mountains, they need more than one antenna to
ensure proper coverage in their areas.

Another theory. Continuous tone Coded sqhelch systems could be causing
that sound. These tones are supposeed to be subaudible, but I have
noticed a lot of times this is not so.

Last theory.... the transmitting station could be broken.

I have used a scanner on Continental flights before. Last March I was returning from LA and when I took my seat an official looking dude noticed my AR8000. He had what looked like flight crew insignia on his lapels. All he asked me was if the radio was capable of transmitting. I said no and he left me alone. Later in the flight, (somewhere over New mexico on my way to houston), one of the retarded stewardesses said I couldn't use it on the plane. I promptly ignored her because the flight crew is obviously in a much better position to decide if my radio was appropriate or not. One moral to this story is "try to get a window seat", if they can't see the scanner then they won't bother you. I had an isle seat unfortunately.

John Kirby

So what's wrong with Popular Communications? I just got a subscription to
that magazine. Why is it going under? Why the hell didn't I know this before
I sent my $22.95?

The PRO-43 "dissapeared" some time ago although stocks of the COMttel 204 remained however these have dwindled and are no longer available here in the UK. There maybe some dealers in Europe wo continue to have stocks of the Commtel 204 (and 203)

> also an original or ancient name for my COM203? Its specifications are
> more or less similar. These are a.o.:

The Commtel 203 is the same as the PRO-39.

Hope this helps.

Fore Sale: Bearcat 890xlt w/PL. The radio is in excellent condition, includes original box, owners manual, and all accessories. This is a first generation model and can be cell modified if you so desire. Asking price is $250.00 plus shipping. Thanks in advance -Dan- KE3UC

2143. Software development for OS-456/535 ?

Newsgroup: rec.radio.scanner
Date: 1996-10-23 00:00:00 UTC
From: "Brett D. Saylor" <bds2@psu.edu>
Message-ID: <01bbc0e2$e577dbc0$0ea5ba92@bds.arl.psu.edu>
Source record: 219544

I've noticed some traffic lately that indicates some people have taken on the task of creating software for the 456/535 interfaces. I recently started to hack together some basic control code for my 535, and am interested in sharing experiences with others who have done the same. For the record, I have also purchased commercial software, but couldn't resist the temptation to see what can be done with the interface.

My code is in Quick Basic (DOS), and I have run across several problems to date:

1. I don't seem to get full replies back from the interface when I send it commands (such as switching it to local mode) while others (remote mode) do return the expected replies. But the commands do what they are supposed to.

2. Re #1 above, I can't use the "7F" series of commands to detect squelch broken or read signal strength (although I can use the DCD line to detect squelch so I can implement scanning/searching.

3. When searching a range of frequencies, I get signals breaking squelch anywhere from -25 Khz to +40 Khz from the actual center frequency. I tried using the 5Khz window command that supposedly fixes that, but that doesn't seem to make any difference.

I'd be interested in sharing code and experiences with others!

>and run 300 ohm twin lead to the TV antenna?

Generally speaking, 300 ohm twin lead is less lossy than 75 ohm coax at the scanner/TV frequencies (30-800 MHz), so using the twin-lead for the long run and putting the transformer (balun) at the scanner is the better choice.

There are a couple of things to be aware of...
1) twin-lead needs to be kept away from steel poles, etc. You can buy "stand-off" holders to keep it away from the tower leg or metal poles.

2) the loss of twin lead increases rather substantially when it is wet. If you live in Seattle or someplace with a lot of rainfall, the advantage of twin-lead over coax is less evident.

You didn't mention it, but I assume you know that the TV antenna should be rotated so that the elements are perpendicular to the ground. That is, rotate it for vertical polarization.

: I'm looking for Secret codes for the Nokia 2110e.

: I understand it is capable of working as a 2 way radio with another
: similar phone.

Cell phones are not capable of talking to each other as 2-way radios, because the transmit frequency of the phone is *always* 45Mhz below the receive frequency. In order to talk directly to each other, one phone would have to transmit on a frequency which the other receives. This is not possible the way the phones are designed.

However, many cell phones have a test mode which allows the phone to monitor a channel and listen in on another phone using that frequency. But newer phones have this "test" feature either disabled or restricted because it encourages people to monitor calls. In some countries (i.e. the US) this is not legal to do.

> for?

The Japanese domestic scene really.

Frequency coverage is something like 850-905MHz with fixed NFM. No memory channels just "instant" search of pre-programmed limits AFAIK.

The MCA button will probably select something like 850 - 860MHz whilst Personal is probably 903-905. don't know about the others (Car/Other Com).

Search & Manual will probably do just that for each of the bands selected (A red LED is above each selected range if I remember OK).

The "Again" button could be anything but if it the same as the MVT-7000 it will revert back to the last frequency it stopped on once it has started searching again !

Thats about it from me I'm afraid :-(

Source record: 219562

Keypad Tricks for the BC-8500XLT Scanner.

Hold the 2, 9, & SCAN keys while turning on the power loads test
frequencies into the following channels.

CH	Frequency in MHz
1	25.0150
2	27.0950
3	54.0500
4	111.0875
5	112.0125
6	224.0950
7	299.0125
8	300.0875
9	418.0125
10	419.0875
11	549.0500
12	760.0125
13	916.0875
14	917.0125
15	1119.0875
16	1120.0125
17	1223.0875
18	1224.0125
19	1229.0875
26	25.5000
27	27.0650
28	40.8400
29	62.4500
30	73.4500
31	87.4500
32	127.1750
33	162.4000
34	195.5000
35	220.5000
36	230.0500
37	325.0500
38	453.2500
39	531.5000
40	765.2500
41	954.9125
42	1085.7500
43	1120.1250
44	1205.8750

45 1299.9125

* So far I cannot find any out of band frequencies but if someone found one such as 888.960, you could unblock the 869 to 894 MHz part of the band. Other Uniden made scanners (PRO-23, PRO-46, PRO-51) can restore this part of the band by this trick. Some of these use several key combo's to load different freq's like 2, 9, & MANUAL loads one type of test frequencies and 2, 9, & LOCKOUT loads different ones. The KEY seems to be that all key combo's start with a 2 & 9 with one other key held while power turned on. This holds true on most Uniden made scanners like the above including the 3000XLT & 9000XLT.

Hold 2, 9, & MANUEL while turning power on to clear all channels to 000.0000 MHz. You can use this like a system reset to clear ALL memories.

Hold 2, 9, & CTCSS while turning power on - counts from channel 1 to 25 Bank (A) very slowly. (not sure what this is for). Any idea?

Hold 2, 9, & PROG while turning power on - Display goes blank and can hear background noise/static like listing to an channel with the squelch open while channel not active. (Also not sure what it's for, maybe a test mode or a Program mode. Very Strange). Any ideas?

There maybe other keypad tricks but this is all I found so far.

If you know anyother keypad tricks for the BC8500XLT please E-mail me.

Already been tried. The confiscations stand. The only
"case law" about it is a NY Attorney General's Opinion that
basically says they can take your scanner but they have to
return it after trial.

That is legally incorrect, and the ARRL has never told
anyone such. The courts decide what the laws mean, not the
ARRL.

You may have gotten a letter explaining why letting hams
have mobile scanners is a good idea, but the League clearly
states that a ham rig that receives out-of-band is different
from a scanner that does not transmit.

Not true. The FCC does not have Constitutional authority over state Motor Vehicle Departments. The Federal courts have already held that state regulation of equipment that can or cannot be used in cars is a lawful exercise of their police power and will not be preempted by any Federal agency.

Also, NY state courts have ruled (the cites are on my website at www.frontiernet.net/~dstark/scanlaws.html) that the state V&T section prohibiting scanners is not preempted because it only regulates a specific kind of receiver and has a specific allowance for Federally-licensed ham operators. It does not, however, say that a ham license automatically entitles you to have a mobile scanner.

Rarely if ever, if they stick with the same radio systems. Since they
are allocated frequencies by the FCC, they are not likely to ever change
them. UNLESS they are in the process of doing a system change over to a
trunked system, which requires changing out the radio equipment in all of
their cars, etc. This, however, is happening more and more often. Find
out what kind of system your local PD uses. If it is an 800Mhz trunked
system, then they will likely be on those frequencies for some time to
come. If not, find out if they plan on spending your money to buy a
trunked system. If that, too is not the case, then you can count on
at least a few years of listening to the same agencies on the
same frequencies.

Just kinda puzzled what frequencies cells go at. I thought they were in the 900 mhz. But then someone told me they were in the 800's. And then another told me its in the 400's. So what is it? Does it depend on the area? I live in Vanouver Canada, so if anyone knows let me know.

Ok its taken me a week to finally finish by artwork and I have it printed with a lazer printer on Transparency Film.

I bought a UV light and all the necessary chemicals from MG.

Problem I have is when I develop, the image appears strong but, slowly seems to fade and the rest of the board goes purple in colour.

The image seems to wash away. What's Wrong? The development time is less then 2 Min. and I'm using MG418 Positive Photoresist Developer and Positive PCB pre sensitized. Developer is being mixed 1 to 6 parts water and my light source is a 15watt UF florescent type tube with a regular florescent daylight tube at the same time because my lamp takes two. The hole thing is about 6 inches away and exposure times have been ranging from 2.5-5 min.

I'm also using a sheet of glass to hold the Transparency flat onto the board.

Should I be pulling the PCB out of the developer the second an image appears?

When do I wipe of the purple material.

Is the material that is left covering the traces not

In Canada the frequency allocations for cell starts at 869.040/824.040 Mhz
up to 895.980/850.980 Mhz (Base/Mobile) these are spaced at 0.030 Mhz steps.

This corresponds to the gap in all RatShack scanners. Although monitoring
cell phones is legal in Canada, Radio Shack only imports USA model scanners
into Canada.

I suspect you're thinking is exactly right. The same thing happens on
our county-wide paging system, where the same signal is output from
all antennas in the county. With "normal" radio coms, the signal is
sent to the appropriate antenna (only) so that this doesn't occur.

> ... an AC/DC power adapter ... The back of the 2006 says 13.8 volt.

12v, 12.6v, 13.8v - essentially all the same animal. A lead/acid
cell produces 2.1vdc. A six-cell "A" battery (i.e. the one in your car)
will give 12.6v and is usually refered to as "12 volt". The charging system
in your car delivers a nominal 13.8v (i.e. 2.3v per cell) to charge the
battery and power the electrical system.

The 2006 power input is nominally rated at 13.8vdc, 10 watt. In actuality
it will accept from 10.5 to 14v and draws 350-500ma. Any 12v adapter that
delivers more than 500ma should do.

Hi Ken,

I also heard the Erickson SkyCrane twice today on 123.3000. I don't know if this is the HeliTanker, Operations kept referring to. It was really neat to finally hear from the SkyCrane.

Other reported SkyCrane frequencies are: 123.1500, 123.2500, 123.3000, 123.3500, 123.500. Enjoy!

Good Scanning makes good friends,

I can't help you with most of the above because I use different processes,
but most glass absorbs UV to some extent. Perhaps that is a contributing
factor.

Discones are wideband and flat, but have NO GAIN! Hence, a whip will behave much better at some frequencies, [has to do with resonance, doesn't it!], maybe worse at others. Maybe better with a different kind of antenna [I've got an automotive magnetic mount stuck to my filing cabinet] with good performance in bands of YOUR interest.

Discones' best virtue is this flat response, which equates to constant impedance [more or less...] - can put a transmitter into them at ANY freq, and hve it do a reasonable job of matching the antenna and TX impedance. no so the other [band-sensitive] types...

I live up in a canyon in Sherman Oaks, and get the same type of conditions you described for N Hollywood and Van Nuys (sometimes) Of course, I don't even receive Hollywood, West LA, but get South LA and all the Tac frequencies.

Also, my handheld Bearcat 2500xlt gets better reception of the valley freqs than my 2006 with a discone antenna at 50 feet.

(But in my office in Burbank, I get them all *CRYSTAL CLEAR* with my Bearcat 855 Xlt with stock antenna)

Go figure.

Don't blame your equipment.

Hi,

You thought your example was weird? Wait till you hear my theory on this!!!! :)

I live in the NW San Fernando Valley and have a Pro-2006 connected to a discone in the attic.

I have noticed this "phasing" you described on LAPD frequencies, but only when the 5' mast that my discone is attached to in the attic has moved off vertical. This used to happen quite a bit after the Northridge earthquake when aftershocks would move the mast. I'd then have to climb up into the attic and straighten the thing out.

I noticed that if the mast was at more than say a five or ten degree angle from vertical, I'd hear what you described on the West Valley and Devonshire Division frequencies. That was how I'd tell if I had to make another trip up into the attic.

Needless to say, I now have the antenna mounted in a more stable way. :)

Hope that helps,

-Larry

Karl:

The La Tuna Canyon Fire was reported on 10-22-96 at 14:15 hrs. The press narrative from our info line is as follows:

TWENTY-NINE COMPANIES OF LOS ANGELES CITY FIREFIGHTERS, THREE LAFD HELICOPTERS AND FOUR LOS ANGELES COUNTY FIRE DEPARTMENT HANDCREWS, ALL UNDER THE COMMAND OF LOS ANGELES CITY FIRE DEPARTMENT ASSISTANT CHIEF RICHARD OLSEN RESPONDED TO A MAJOR EMERGENCY BRUSH FIRE NEAR 4500 NORTH LOWELL AVENUE IN THE TUJUNGA AREA. THE FIRST COMPANIES TO ARRIVE ON SCENE REPORTED NEARLY FIVE ACRES OF GRASS AND BRUSH BURNING ADJACENT TO THE EASTBOUND LANES OF THE FOOTHILL FREEWAY BETWEEN LA TUNA CANYON ROAD AND LOWELL AVENUE. THOUGH THE FIRE, FANNED BY LIGHT WINDS, QUICKLY GAINED GROUND OVER THE STEEP AND RUGGED TERRAIN, PRECISION WATER DROPS BY THE HELICOPTERS HELPED TO CONTROL THE BLAZE WHILE FIREFIGHTERS WITH HANDLINES BRISKLY FLANKED THE FIRE. THEIR WELL COORDINATED EFFORTS WITH THE HANDCREWS CONFINED THE FIRE TO LESS THAM 35 ACRES. THE FIRE WAS EXTINGUISHED IN 3 HOURS AND ELEVEN MINUTES. NO STRUCTURES WERE THREATENED OR DAMAGED. ONE LOS ANGELES CITY FIREFIGHTER, SUFFERING THE EFFECTS OF HEAT EXHAUSTION WAS TRANSPORTED TO VERDUGO HILLS HOSPITAL FOR OBSERVATION. HE WAS TREATED AND RELEASED. THE CAUSE OF THIS FIRE IS CATEGORIZED AS "UNDER INVESTIGATION".

<Yawn!>

Karl, as you are aware, we welcome the public to call our our taped media info line. On this recording are daily stats as well as details of SIGNIFICANT incidents that have occured during the PREVIOUS CALENDAR DATE. It is updated by 08:00 Pacific TIme each day.

I should have used this as a followup...sorry for the dupe...

First Impressions
The AOR AR-7000 Scanning Receiver
Copyright (c) 1996 Michael E. Harpe

I got to spend about 3 hours with an AR-7000 at the Monitoring Times Convention in Atlanta from 10/18-10/20. What follows is my first impression of the unit based on my playing with it. I had no manual and folks from Grove knew nothing about the unit and brought it along anyway. Thanks, Bob!

The AR-7000 is yet another "DC-to-daylight" receiver built around DSP (Digital Signal Processing) technology. The unit description provided in the previous article was correct so I won't repeat it here...

I sat down at the unit and was immediately impressed with the sparse, yet functional control panel. The user interface is the LCD, a keypad, a four key "joystick" arrow keypad and a detented tuning knob. The user interacts with the unit by selecting different functions on the keypad. Menus are presented to the user for scan and search programming. The menus are reminiscent of BIOS setup menus found in most PCs. The interface is fairly intuitive. I was able to set up scan and search programs after only a few minutes of experiments. The unit can store eight different scan programs and eight different search programs. This makes finding new frequencies a breeze.

The unit's operation will take some getting used to. The squelch is set by selecting a function key marked SQL and rotating the one knob. Other parameters like IF bandwidth, modulation mode, filter width and volume are all set with softkeys and the one knob. Curiously, volume is set by holding down either a raise or lower key marked volume. Entering a frequency into one of the dual VFO memories is accomplished by pushing FREQ and entering the frequency on the keypad. The knob does tune the VFO memories as expected. I would prefer a separate knob for the squelch.

One nice feature of search is that the unit displays signal strength as a moving
histogram that shows strength relative to the squelch threshold. I found this very useful. You must hit SQL to adjust the squelch threshold and hit ENTER to keep the selected setting. I kept making bad entries because of all the function selection I was having to do. This feature does eliminate the problem of not hearing something because the squelch is set too high.

The filters were quite sharp and served to quiet noise down very well. I can't comment too much on performance other than to say that the unit did eveything I asked of it. We were located directly across the street from Hartsfield

Airport and I heard HTs being used by ground crews quite clearly.

800 MHz performance seemed OK. It received everything we wanted.

HF performance seemed OK. I don't know what kind of antenna the unit was connected to so I can't comment on the performance. We received WWV on 10 MHz with about an S5 indication. Tuning around on HF is awkward because of the detented knob. The detented knob is a bad design feature and should be replaced with an optical knob in the production unit. Any radio that is used on HF needs a very smooth control.

Overall, I liked the unit. It was next to an ICOM R-8500 and I got a chance for a little side-by-side comparison. One thing that was really obvious was that the ICOM has much better audio. The AR-7000 audio is a bit tinny for my taste. The AR-7000 user interface is superior to the ICOM's. I felt the ICOM was too obscure and required too much time with the manual. On the other hand, the AR-7000 requires a lot of keypad work to set up some things. Lack of a separate squelch control is not good.

Yes, mine is a RS antenna, but it's the more expensive model ($60). I was impressed with it's material -- stainless steel. Had to use a cobalt bit to drill a hole for attaching a ground wire to the short little mounting mast that came with it. The cable is a taut as seemed reasonable, and it does not loop on itself at any point. However, it is RG58 and 75' long; I could put in heavier cable, but can't do much about the length of the run.

Mike, the problem is not the length, , , It's the TYPE! RG-58
should not be used for this length. You should try RG-8 or
similar. Also watch your connections. AND, , DO NOT make the line
"tight" or "Taught" as the RS person said. It needs some slack for
temperature expansion and contraction.

The best software I have found is Scan*Star from Signal Intelligence.
I think I must have tried nearly all the programs out there. There is
a free demo downloadable from their web site at:

http://www.scanstar.com/

The software drives a number of Icom, AOR etc. receivers but no
drivers are available yet for the Icom 8500 or the AOR AR5000.
Hope this helps.

While I find it some what hard to believe that someone needs dedicated software when you have win 95 and office 95, I'll give it a spin just for fun. ;>0

You can just write the ar8000 commands to a plain text file using something as simple as notepad and then simply send that file to the scanner at 9600 baud. Remember to set the new line delay to around 100 milliseconds so to give the scanner time to process the more complicated commands. One can capture the data from the AR8000 by simpling turning on capture command in Hyperterminal and sending commands to the scanner in an interactive manner.

Microsoft Access, Excell and Word 95 all have strong points for manipulating the data from or for the scanner.

: >joints are. :-)
: The majority seem to congregate on the Logic/CPU board, but I've seen them
: in all areas of the receiver. There isn't anything to mention until
: troubleshooting and diagnosis have been performed.

I also found problems with the platted through holes (or the lack of them!).
When mine quit, I couldn't find any logic voltage from the power supply.
During the course of troubleshooting, I had voltage on the top of the pc
board, but nothing on the bottom!!! Cured this by using a solder sucker to
get all the solder off of the bottom of the pad, inserting a wire wrap wire
into the hole with the componets and then solding top and bottom(yea I know
why didn't you just solder the leads on top and forget the wire. I tried
that, but the quality of the pads was so poor, that adding a wire and making
sure the traces were soldered made the radio work!).

Great radio, bad assembly practices!

What I don't get is that if everybody thinks the guys at Radio Shack are idiots, then why all the complaining. In my book they are simply salesmens (or salespersons) which I place somewhere close to lawyers. You can't trust either of them.

I go to Radio Shack because they provide things that are difficult to get elsewhere and prices can be very reasonable when thing are on sale. I recently picked up a DSP on a manager's close-out table for $27.00. It works great with my scanner. It cuts out a lot of hiss and high pitched whines. An unexpected benefit was that it almost totally cuts out the keyboard beep on my PRO-2006.

Back to my point. Just go into Radio Shack assuming the people there have no idea what you are talking about and find what you need yourself. While your looking you may find something you (and the salesperson) didn't know they had.

Yes, and all are digital technology. I had a PRO-2030 there for two years and got zip in that freq range. However, I did hear some Dutch telephone (patches?) in the 450 MHz range. I don't think it was 70 cm autopatch but rather an older form of mobile telephone. Anyone have any ideas on this?

Not true either. FRS "lower 7" are shared with GMRS type-accepted equipment (Part 95). I use the lower 7 interstitials quite extensively on my GMRS equipment. I can only hope when the FRS users start showing up, they use the "upper 7". I know this won't be possible with RS's new FRS handhelds that have only the lower 7 channels but the new MAXONs and Motorolas should have the full 14 channels.

I just got a DSS system. After I get over the initial cost of the system, I'll be paying less than I did for cable (TCI) with more channels. The current $200.00 rebate will go a long way to cover the initial cost.

Primestar in this area is handled by TCI. I don't know about other areas. Because of the experience I had with TCI, I wanted nothing to do with Primestar. Also, when I started researching systems, I called Primestar's 800 and asked for information. They told me who handled Primestar in my area and said that they would send information. I never received anything. You would think that they would want people to actually subscribe to their service.

In case your interested, DirectTV and USSB (DSS service providers) both have WEB pages. I believe that the DirectTV site has a comparison of the different systems.

>
> -Draco

Hello Draco,

most of the Fast Food drive-thru systems operate as a half-duplex system. The 154.520 Mhz frequency that you found should actually be 154.515 (you're off by 5 Khz). According to most listing that I've seen, the matching frequency should be 33.160 Mhz. The 159.890 Mhz frequency that you found doesn't make much sense, it lands right in the middle of the Motor Carrier band (LJ). Most drive-thru systems are allocated to the business band (IB) and wireless mic frequencies.

John,
KA3LIE

This may help....

San Diego local- 151.190
Statewide F-1- 151.355
Statewide F-2- 151.265
Statewide Red- 151.220

Three aircraft freq.'s are used for tankers, at least one of these
will be for your area.

Blue Air- 151.280
Green Air- 151.295
Yellow Air- 151.310

Tones are signifigant in that they key in specific repeaters....The
CTCSS as you know varies.

Tone 1- 110.9 Hz Tone 5- 146.2 Hz
Tone 2- 123.0 Hz Tone 6- 156.7 Hz
Tone 3- 131.8 Hz Tone 7- 167.9 Hz
Tone 4- 136.5 Hz Tone 8- 103.5 Hz

Hope this benifits anyone that may use it.....5150

>funny part!)

Hmmm...they do that in your area too, huh?

Reminds me of the time I overheard Sammy Salesdroid trying to sell HTX-
202s to a construction foreman because "they have more channels and talk
further than these do." ("These" being the standard CB walkie-talkies)

License? What license? DUH!!!!

"You've got questions, we've got Salesdroids."

Yep.

Not so much "unstable", but that one transmitter is simply 3Hz
off frequency from the other.

If it is an 800MHz system, 3Hz is probably within spec. And of
course, 800MHz systems use multiple transmitters on the same
channel.

Two signals coming in at relatively the same level can add or
subtract from each other as they "beat" against each other.

You would really hear this effect if it was AM, but the limiters
and capture ratio of the FM receiver tend to "even" it out ("full
scale"), except for when the signals severely cancel each other
out (the "valleys").

You must be between the two transmitters. Try to find a "null"
spot where one of the transmitters signals is weak, or use a
directional antenna, and the received signal should clear up.

The two signals are cancelling each other out *at* the antenna,
so there is little the scanner can do.

Also, the transmitters may not even be carrying the same traffic!
But their carriers will interfere just the same, and you will
hear the audio from the stronger of the two.

It's a normal (and annoying) "phenomenon".

2233. Bearcat Squelch Adjust--where?

Newsgroup: rec.radio.scanner
Date: 1996-10-24 00:00:00 UTC
From: "Geoffrey T. Cheshire" <gtc@U.arizona.EDU>
Message-ID: <327060DD.5A0F@U.arizona.EDU>
Source record: 219384

Hi all,

I'd like to adjust the squelch (internal adjuster) on my SC150 Bearcat without having to buy a schematic from Uniden. The squelch is too sensitive even at the full-left position. The SC150 has the same setup as most newer BC scanners (I think!): the RF board to the rear coupled to the logic board to the front. There are several pots up by the antenna & control knobs at the top of the RF PC, but I can't tell just by looking which one'd do the trick. Does anybody know which one is the one I need?

Thanks,
Geoff

ps, please Cc: to gtc@U.arizona.EDU so I don't miss aby replies!

I am relatively new to scanning, I just purchased a PRO-2035, and am looking for a good antenna, and computer interface, any suggestions are appreciated. Is the RadioShack discone antenna a good selection or is there another that would be a better choice? I am in somewhat of a rural area, are there any guides as far as antenna height?
Thanks again for any help.

to owners of: this scanner.

How do you find this scanner for its efficacy ....?
I have had this 890xlt for about three years now
and i find it to be the most putrid-working unit
I have...and I have plenty scanners to compare.

It's only good on the low freq range...but put
it to the test on others and nada, nope-response,
negative, major no-no, bust my b...s gist, nothing
happening here....

Even the 800's are "lousy with interference" off
all four antennae and with an indoor 800 fixture
piece.

so how is this unit rated by users in areas other
than the East Bay Area of the San FranciscoBay
Area in California.....

bill conduit
etc.

I just recently purchased the latest edition of both the Scanner Master Massachusetts and Metro New York Guides, and they are excellent. I highly recommend them if you live in either of those locales. They are much more than just frequency lists.

I figure that a motorola 68HC11 family device and an 4x40 or 4x20 char
LCD with two serial ports + 32K RAM should do the trick. Small too.

One port to run the scanner, and one to connect to the computer
for programming / OR, if I really felt ambitious, a few knobs to
allow for the onboard firmware to permit entry of the names / FQs.

I suppose only one serial port is required depending on the 'mode'
of operation.

>"phase-in, phase-out, phase-in, phase-out" effect on their actual carrier
>signals.

What you are hearing is probably the results of picking up 2 or more transmissions from the LAPD.

It could be a quasi-synchronous network that they have. If it is a quasi-synchronous system, the following may help to understand what is going on and how you get this fading in & out or chuffing sounds. Quasi-sync can be used with both AM and FM transmissions. The sound effect in the overlap area is different on each.

For certain services, a single transmitter may not have the coverage needed to give assured service in a given geographical location. To get round this, multiple transmitters are put in prime locations, ALL of them on the same frequency and transmitting simultaniously. These locations are chosen to give an overlapping coverage.

This give rise to two major problems:-

1) The mobile users in the overlapping areas can receive 2 or more signals. These signals can and do interfere with each other.

2)Frequency stability. The standard transmitter oscillator is stable enough when it is used on its own, but totally inadequate when put into service with multiple transmitters

If the stability of the frequency is not good enough, the interference
can be so bad that the transmissions could be unreadable, SO

The use very expensive, High Stability Master oscillators and attempt to "lock" the frequencies to within 12 - 15 cycles. This actually does work - IF the frequency is separated very, very slightly!

What you are hearing is a Q-S system that needs the radio engineer to do his rounds and reset the master oscillators to within 12 - 15 hertz of each other! (Even the best of kit needs a regular tweek from time to time.)

With an AM Q-S system this "closeness" of frequency will give rise to the receiving equipment detecting the signal being increasing in strength when the two frequencies are in phase with each other. When

they are out of phase, the signal decreases in strength. Because the signals are coming in and out of phase at about 12 to 15 times a second, this is rapid enough for the audio (whilst degraded slightly) to be quite readable and the 12/15 cycle chuffing not being objectionable. (The principle is that the mobiles are travelling through the overlap area and the signal cleans up in non-overlap areas.)

If the frequencies are locked together at a closer relationship, say 3 - 5 cycles, the in & out of phase becomes so detectable as to be objectionable and gives rise to a regular "swishing" or chuffing sound.

With an FM Q-S system, the signal strength remains fixed but the audio becomes "ragged at the edges" almost as if the speaker wants to cough.

The base (despatcher) stations do not hear this multiple path transmissions, even though 2 or more of the repeater receivers can be picking up signals from the mobile. What happens here, is that all the receiver signals from the various repeater locations are fed into a "black box" (a diversity unit). This box is also given information as to the signal strength of each of the signals detected and it only allows the strongest to be fed to the dispatchers speaker (or back to the transmitters if it is on talkthrough.)

I hope that this explanation helps to understand what you are hearing and how it works.(I haven't gone into other problems of the audio coming out of each of the transmitters at a slightly different times due to propagation delays, nor the need for identical audio phase envelopes to be transmitted - I thought that it might confuse the subject!

BTW: I operate a four site FM Q-S system and also "look after" an FM Q-S system for a local County Council. They can be a nightmare to set up and keep happy! Our local police use an AM VHF Q-Ssystem and their transmittions have been terrible with a 1 to 2 hz seperation - almost made me switch off!

Happy days to you all

I thought we were discussing scanner publications in general. RCMA, NESN, USSN, etc. beside the magazines. I think most of the magazine publishers have learned the lesson already - otherwise they wouldn't still be in business. These clubs and private publications are having problems that may not be entirely due to the economy.

Hello Daniel

For some fresh AR8000 software, watch out for CHANNEL COMMANDER V2.00
soon to be released. Written for WINDOWS 3.1 and above.

A freeware full-feature version will be lodged on a web server in the
near future.

I will post further details a little closer to the date... Very soon
now (I hope!!)

Regards to all

BTW: Daniel, It's good to see a Kiwi poster - not many about - where
are you? I used to live in Titirangi, NW Auckland.

: Too see more.. Try the following web page: http://www.scancat.com

: They are the makers of ScanCat. There is other software available but
: I don't know of the webpages for it.

I bought ScanCat to use with my AR8000, and I found it to be deficient,
badly designed, badly documented and rather buggy. Its scrolling-channel
displays are poorly programmed and confusing, it does not allow you to
program "passed" (locked out) channels ... I could go on ...

As a professional software engineer the poor design and programming in that
product is painfully obvious to me. When you charge someone just under US$100
for a program, it has to be of acceptable quality!

The worst part is when I raised these issues with Jim Springer, he offered
me a free upgrade to the (soon-to-be-released) Windows version of ScanCat
(which I don't want, I don't want to run Windows on a machine just so I can
computer-control a scanner!) and then basically said he didn't care about
the deficiencies in his software.

Writing a good scanner control program isn't a very hard project, so my
approach to this problem has been to start working on my own. The best
way to teach Jim Springer that customer satisfaction is important is to
compete with, and outdo, him in the marketplace. Of course I'll be doing
this in my spare time and not as a full-time job, but I'm looking forward
to the day when I can offer the market a cheaper, better and more reliable
radio control program than ScanCat.

The standard AR8000 whip is crap (why such a lousy antenna with such an expensive scanner?). You can replace it with any BNC-mounted antenna, have a look at Grove's catalogue or WWW site for ideas. I've got Grove's 42in whip (good gain!), a dual-band 2m/70cm amateur antenna, a UHF CB antenna and some others. Normally I just use the telescoping whip on the AR8000 and leave the others for the Scout.

You need to do that only if you suffer from the "wandering birdie problem"
(that's where you get birdies that move around, meaning you can't just lock
them out).

The mod involves replacing the small ceramic-cased oscillator with a metal
cased equivalent - just some fine soldering. There are detailed instructions
on the WWW for this - try a search for "wandering birdie".

>volt. I haven't seen one exactly 13.8 volt. HELP! -Scott

Useing an external supply would reduce heat in the unit, which would
probably extend its lifespan, heat being one of the biggest enemies of
semiconductors. The 13.8 volts correlates to what a vehicle
alternator puts out. A 12 volt supply will work fine, as long as it
will provide enough current, and is (preferably) regulated.

Mark

The truth as I perceive it to be.
Your perception will be different.

I have the SA-80 unit which you should have along with the SA-78 or at
least the SA-80. The 78 eliminates the beeps but does nothing for the
buzz. The 80 eliminates the buzz about 80% which is much better than
listening without. I haven`t opened the pkg on unit and is new. Sell for
$35.
The G/WIZ works very good and I would also reccomend it to users as one
unit doing both the 78 and 80 all in one.

This is not uncommon. Tower radios can be low power with a low antenna because they have line of sight to their targets, the planes. The planes, of course, have line of sight to a wide area including your antenna. An elevated outdoor antenna might be required for you to hear the tower.

Yeah, I bought that, too. Couldn't resist, Marked all the way down from $79. When I got home I found out that IT SUCKED in most applications.

It does, however, work well with the AM heterodynes. I think that this would be better for CBers and DXers.

When I used it to remove the cellular whine it made ppl's voices come in as if they were talking through a pipe! The same for distant TXs (better yet tubular).

The best application I saw on it was the CW section....It would pick out those little beeps a hell of a lot clearer.

Anyway, the poor salesdroid that sold it to me couldn't even figure out what the heck a DSP was...I mentioned something like, "Dolby uses the same type of signal processing for surround sound."

Then he replied to the tune of, "why would you want to make your scanner surround sound....?"

Let me tell you...complete morons (pronounced MOW--ronz). I get a kick out of these guys. Hell, even my fiancee laughs at them.

I exchanged the unit for something else.

Dave
(Scanner Flatulaire)

BTW, there is a better way to remove the beep completely off of the 2006, use a switch if you want to have control over it's state.

Looking to purchase a non-working Pro-30 hand held scanner. These were sold about 10 -12 years ago or there abouts. The one I purchase should be in very good to mint cosmetic condition as what I need is the plastic exterior case. I own one that works great. Years back it took a dive from the roof of a car and the radio survived, the case did not! I would like to put it back to as near original shape as I can as it was my first programmable scanner. I was told that RS doesn't have parts that far back and I called GRE who told me they couldn't help me. Anyone out there with one of these that may have some fried innards???
Thanks.

2266. Does Any 2700 Software WORK (well)?

Newsgroup: rec.radio.scanner
Date: 1996-10-25 00:00:00 UTC
From: csmith1@ccgate.hac.com
Message-ID: <54r52i$djs@newsroom.hitc.com>
Source record: 219231

I have a new AR2700 and am getting very frustrated trying to get software to work with it...at least like I would think it's SUPPOSED to.

I bought SCANCAT GOLD, both the DOS and then the Windows versions. It seems flakey to me with the 2700. For one thing, their makers say the squelch has to remain open during a search to get signal strength back, but THAT's pretty annoying to use that way. Also, the pop-up windows misbehave, the searching stops for 5-10 seconds without a signal--then resumes, and the various controls like the continue delay don't seem to work right to me. [This on the new Windows version.]

The same sort of story seems true with Radio Manager ("RM") shareware--doesn't seem to work right with the 2700. Controls don't seem to work correctly or as one might expect. For one thing, the default settings do not work and once you get into diddling parameters, you have no idea what to diddle how much (many of these packages seem to give you adjustments, but procedure for how to optimize what you're doing for a particular radio).

In both these cases, the documentation is either poor or too generic for a particular radio (I have had trouble with getting my Icom 706 to run with RM and SCANCAT too).

Yes, I will seek additional tech support (and have to wait for it), but does anyone have any GOOD experience with software for the 2700? I did find the AOR PC Manager software to work pretty much, albeit very much limited in capability. *IT* does not seem to work consistently in the spectrum analysis area.....gees! It's also a remote control type program for the radio as opposed to a more fully featured PC-based radio control program (there is a subtle point here it seems).

Thanks & please respond to csmith1@ccgate.hac.com and 76033.1161@compuserve.com (someday I'll get my eMail doing what I want to <g>).

Source record: 219233

I don't have the cellular mod for the BC8500XLT but I have recently found an old newsgroup message from someone name Jon who claims to have a mod to enter out o band frequencies on the 8500 between 25 to 1300 MHz including the blocked out 800 MHz parts. He claims to have already modified two BC8500XLT scanners. The message only talks about the mod but does not include it.

I don't have this person's e-mail address but he goes on to say that he will be contacting Popular Communications to see if they will mention it in an up comming issue.

What I would like to see if someone has all the Popular Communications between 1993 to 1996 and check in several places that it might be, like the scanner column or letters area. Assuming that he contacted them and they published it.

If someone does find it or knows of this person please E-mail me.

> Editor, Pop'Comm

Thanks Harold for the info. I appreciate your response and I'm sure many others will be glad to hear that all is as well as can be expected under the current market and economic conditions. It is so easy to get a rumour started on the net and with the change of editors and moving around of authors at POPCOMM it was easy to see that one coming.

Keep up the good work. I'd like to see an article on a really solid RS-232 to TTL interface for the SCOUT, AR8000 and AR2700 built around the MAX 232 or 233 chip.

> MAXONs and Motorolas should have the full 14 channels.

Hopefully, they will. That is the main reason I find the RS (made by Motorola, BTW) unit distasteful. It's like selling a CB with only 20 channels. Are GMRS users that worried about their frequencies? I have gotten that impression quite often. Perhaps it's time for a "gentleman's agreement" similar to the one the CB AMers have with SSBers. The good part for you GMRS users is that the FRS units will be low power enough that they shouldn't interfere with you too much...

Granted. However, MS-DOS SORT is available on every MS-DOS
system at no extra charge, making it an immediate solution
without the cost and effort of buying yet another software package.

Each one has its place, and I would not want to discourage
anyone from buying the product that gives them the best
solution for their problem.

Sorry to reply to my own post, but by futzing around I was able to figure this one out on my own. The squelch trim is located, on the SC150 at least, just below the volume control on the PC board. It's a white component with a phillips head top and has no meatal case. It's directly adjacent to a 220uF cap.

What Kind of scanner do you got?

Well here is one possibility...When you program the freqs., it should say AM somewhere by the freqs. being displayed on the scanner, but if you tell me what scanner you got I could help you even more, so get back to me with your type of scanner u got...bye

2277. Canada and a 2.5mm Stereo Jack/Plug?

Newsgroup: rec.radio.scanner
Date: 1996-10-25 00:00:00 UTC
From: dmitton@mulberry.com
Message-ID: <54rcm3$ine@gollum.kingston.net>
Source record: 219242

I'm going to ask another basic (?) question.

I've been trying to add the "scout port" mod to my AR2700, I can't find a jack small enough to fit inside the package. All I've been able to locate to date is the Radio S. 3.5mm items and they are about twice too large for the recommended location ... above the 12vdc jack inline with the bottom row of keys. They won't fit any where else either.

Any one have any ideas on a Canadian source of these things ... a chain type store would be nice too! :-)

Thanks in advance!!!

I received the new keypad and installed it, and the problem went away.
Evidently these keypads have some conducting material overlaid on the
surface of the rubber, and I guess it just wears off.
Thanks to those who replied.

>10 - 2 - 4
>Good Anytime

one thing: i really would like to leave this as is, but in all fairness to RS, this guy seemed to know his knots and ties.... he said not to leave cable "over"... in other words, not loose and untaught...but like on roofs you can allow for some excess to be put into a circlular pile....he said this is to be avoided....allow it to reach the radio plus some flapping in the wind or such....

I bought the RS 60 model...that sucked. I ended up with a model that went for $99.95 from either GROVE or a local electronics house dealer over in San Francisco...where there is a Radio Shack Store on Market Street that has peopel who know what it is is going on .... and one over in Bezerkley too... on Shattuck st. Other than that it's anyones guess...where to go and what not to say....

I liked that one: and both of you can find things even RS did not know they had in stock....cute.

>Read the Turner Diaries (Do a net search)

The trouble with the Turner diaries is that it is a piece of neo-nazi trash. It starts out interestingly enough, but slowly and surely it gets more and more racist. So while it has an interesting plot, it gets pretty sicko at the end. Especially about 'race mixers' and 'The Day of the Rope'.

I am not a fiction reader, but the ad I saw I a gun magazine peaked my fancy, and I ordered it not knowing any better. So while I can now say I have read it, I wouldn't reccomend it.
cheers

Andrew Helyer <helyer@mail.utexas.edu> writes:

> I've also heard that Belden-9913 is great.

It is, but it is very stiff and cannot be bent in tight arcs.
However, if you want great reception, you need to accept
these things.

> And regarding the Belden 9913 coax. It's a much larger copper core
> (11AWG I believe). How do I get that wire connected to the BNC
> connector on the 2006?

The only connector I know that is made for Belden 9913 is the
Amphenol 82-202-1006 plug. This is a type-N plug, so you
will need to use a N-to-BNC adaptor. Amphenol also makes
a crimp-on Type-N connector for 9913, but it is not practical
for the person who only needs one or two connectors.

You can get the Amphenol 82-202-1006 from Digi-Key (800-344-4539)
under their part number ARF1020-ND. The price is $6.69 each,
but they have a $25 minimum order.

Other parts that you will need:

Type-N right-angle adapter - Amphenol 82-64, Digi-Key ARF1028-ND, $19.02
(This assumes that the coax enters your room from any direction other
than directly behind the radio. Two of these will give you a lot
of flexability in positioning your radio.)
Type-N to BNC adapter - Amphenol 31-217, Digi-Key ARF1102-ND, $10.26

Two connectors (I assume that you need one at the antenna end also)
and one of each of the adapters will put you over their minimum order.
Yes, Amphenol prices are high, but high-quality will save you money
and grief in the long run.

You can call Amphenol (203-743-9272) and ask for a copy of the
Assembly Instructions for Clamp-type N connectors. They will
FAX it to you immediately.

Hi Hal,

You have to be fairly close to hear the Tower frequency. I live about
10 miles from Dulles Intl Airport, just outside of Washington, DC and
can barely hear the tower.

Are you sure that you're tune to the right frequency?

Boston Logan Intl Airport operates on the following:

UNICOM: 122.95
ATIS: 135.0(617-567-0160)
BOSTON GROUND: 121.9
BOSTON TOWER: 119.1
121.75(HELICOPTERS)
128.8
128.8
BOSTON APPROACH: 118.25(NORTH)
120.6(SOUTH)
127.2(WEST)
126.5
BOSTON DEPARTURE: 133.0
CLEARANCE DELIVERY: 121.65
PRE-TAXI CLEARANCE: 121.65
(ARR/DEP RYS 04R/22L 09/27): 128.8
(ARR/DEP RYS 4L/22R 15R/33L 15L/33R): 128.8
(ARR/DEP RYS 4R/22L 9/27): 119.1
CLASS B: 124.1(091-269)
124.4(270-090)
EMERG: 121.5
GATE CTL: 134.05
IC: 120.6(SOUTH)

Just remember these are intended for use on the belly of an aircraft and
the radiation pattern may be undesirable if used otherwise. BTW, I'm not
blowing smoke out of my ass...12 years in the USAF has given me plenty
of experience with these antennas.

I would strongly advise against any attempt to change the E.S.N. or any other
operational aspect of cellular phones. To do so is a violation of U.S. and
Canadian Law. You're cellular carrier may provide a second phone capability
on your current M.I.N. without changing the ESN on your second unit. Of
course they will charge you for it!

2300. PRO2004 PROBLEMS

Newsgroup: rec.radio.scanner
Date: 1996-10-25 00:00:00 UTC
From: jkracke@grci.com
Message-ID: <54qjog$3p2@west.grci.com>
Source record: 219265

Okay, I am going to throw this on the table for anyone to help.. I have asked the infamous BC for assistance and the advice (the FAQ regarding bad solder joints) he has given me is plausilbe and most likley the culprit. What I really need to know is what specific area (component ID) should I be looking at.. Or, if anyone can point me a a specific resolution that would be very nice too.. Here are the problems:

SCANNER NUMBER 1:

Problem 1: The scanner works well and receives all freqs without problem. When it is first powered up, I get a scratchy sound that soon goes away. After it has been up for about fifteen minutes or so, the sound (audio) starts to fade to nothing. The scanner still scans, still stops on various channels, but no sound.

This is what I have been able to determine about Problem 1.. using a heat gun, I can recreat the problem if I shoot warm air in the area of the power supply.. Using a can of cold spray, and heat, I cannot isolate the problem to any one specific componient. I have replaced just about everyting in that area.. I have replaced the processor board so I know the noise is not from IC502 (I have two scanners and the problem does not follow the processor boards)

Problem 2: On occasion, when I power up the scanner, the display light illuminates, but nothing is displayed and there is no sound regardless of the volume setting, nor is there andy "beep" when I try to manually sellect a channel or enter a frequency. If I turn the set on and off several times, it might start working.. If I leave it on and walk away, come back a little while later, it will be working, but ALL of the ten channel banks are selected when I only was scanning on the first bank. Then the audio problem is repeated in "problem 1" above.

I have absolutely no idea what is causing Problem 2. I have left the scanner run continuously scanning bank 1 and come back several hours later to find all ten banks selelcted.. This is a very intermittant problem I have replace the processor board with one that I know is good, and the problem still persists.

SCANNER NUMBER 2:

Problem: Scanner works well. It scans, receives, sounds great however, the audio on anything in the 800MHZ and above ranges sounds like it is coming from a microphone with wind blowing on it (similar to a sound of a dirty volume control). I replaced the processor

board and the problem is still present. So I don't think IC502 is the culprit here either..

So, anyone want to take a shot? I have the service manual. I do not have a signal generator, but I do have an O'scope and a handy dandy VOM.

I would appreciate any advice (toward solving the problem that is)...

John

2303. Fun with Police Video mikes!

Newsgroup: rec.radio.scanner
Date: 1996-10-25 00:00:00 UTC
From: n9jig@TheRamp.net
Message-ID: <n9jig-ya023080002510962154270001@news.TheRamp.net>
Source record: 219268

I am a police officer in a small town near Chicago. We recently installed an in-car video system with a wireless mike. The officers switch off the mike when not on a stop, but the receiver is still active. The other day one of our officers was on patrol, and heard voices coming from his receiver. They were apparently High School kids messing around with a video camera and mike, and posing as homeless people to film the reactions.

They were having great fun bothering the merchants and passersby, and had been kicked out of several stores while the officer was tracking them down (With the tape running...). When the officer found them, they "freaked" and hightailed it to their brand new Explorer. They left the mike on, and were afraid they were going to get arrested for various infractions. They were followed out of town, and eventually stopped for a traffic violation just outsdie of the village limits, right after they said "Well, he can't stop us now"

Imagine their faces when they were quoted word for word.....

BTW: Most in-car video systems work on regular wireless mike freqs from 169 to 172 MHZ.

From: Radioman@localnet.com
Message-ID: <54p04u$k5p@prometheus.localnet.com>
Source record: 219396

On the realistic PRO-62, are there any keyboard tricks available to do anything interesting? Also, it appears that even images of the forbidden cellzone are not received. Is this because it has a tripple conversion circuit?
Regards,
Ray Miller N2NJK

I bought a Yupiteru MVT-7100 from them a couple of years ago. I had no
problems, and they've been helpful for a couple of questions I have
e-mailed them since then.
They have been very good to deal with.

>that radio scannign is a real hobby, what hobby IS there to radio scanning
>apart from listening to it?
>I would beinterested as well :-)
>pls reply to gacs@ozemail.com.au

First of all, your mother should know that young men with scanners are irresistibly attractive to voluptuous, wealthy, insatiable young women. Second, owning a scanner makes you a member of a powerful and elite secret society which will one day rule the world. Lastly, thanks to an obscure clause in a 1988 farm bill sponsored by a senator from the midwest, we scannists all receive a $250K per annum stipend, free medical care, and unlimited duty-free alcohol, all paid from a secret account funded by the CIA.

If you can handle action, adventure, and danger, scanning is for you. There's no room for wimps.

OK, I may be exaggerating a little. Seriously, listening to a scanner tends to get you interested in how you can make weak distant signals come in better on your radio receiver. That leads you into learning about radio, and electronics, and maybe computers. You start tinkering with your scanner, or building antennas, or looking for new frequencies or rare and unusual stations. This may lead you to getting your ham ticket, or taking technology courses, or even studying for a career in radio or telecommunications. You meet some nice people. Mostly it's just fun.

Cheers
Paul

>>
>> Can anyone explain to me how the loading on an antenna works? I know
>> what it does, but I don't know what it is or how it works. What's the
>> physics behind it?
>>
The loaded part is a coil. Coils, by their nature, simulate a
"longer" piece of wire than what they actually are. By adding a coil
to an antenna, the antenna behaves as though it were much longer. In
this way, by adding a 1 1/2" long coil to an antenna that's about 30"
long, it will behave as though it were 9' long (a CB antenna).

The physics of this are very predictable, with factors of coil
impedence and reactance, frequency band, and actual antenna length all
part of the equations to arrive at an "optimum" coil and antenna
combination.

Mark

The truth as I perceive it to be.
Your perception will be different.

>I'm looking for some thought re this gizmo.
> I'm having a little attack of technolust...

From the "Buying a Used Scanner" FAQ:

PRO-2042: 1996 version of the wide coverage PRO-2035 base
with improved firmware and amber display. Made by GRE.
1,000 channels, but cumbersome 100 channel bank size.
Tuning knob. NFM selectivity is still a problem but
improved over PRO-2035. 10 linkable search banks. Smart
Auto Store feature stores the unique frequencies. Can lock
out up to 200 frequencies from search. Query facility
indicates if and in what channel a frequency is programmed.
Scan skips over empty channels automatically. Can sort
memories by frequency within a given bank. IFs are 609 -
612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than
PRO-2006. Overall, a top grade scanner and second only to
Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042,"
by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

Reprints of articles from Monitoring Times are available
for $2.00 each plus a self-addressed stamped envelope from:

Grove Enterprises, 300 S. Highway 64 West, Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

Note: I don't get any part of the $2.00.

I'm not very familiar with your um, technical vernacular, but it sounds like you're describing more of a personal problem than anything else!

> Even the 800's are "lousy with interference" off
> all four antennae and with an indoor 800 fixture
> piece.

You seem to want to blame the scanner. I think a reasonable person would factor in variables such as the RF density of the physical location, among other things.

> so how is this unit rated by users in areas other
> than the East Bay Area of the San FranciscoBay
> Area in California.....

IMHO, it is a decent scanner, for the price! I've had one for 3 or 4 years, along with some PRO-2006s, 2005s, FRG-9600, R-7100, PRO-43, AR-8000, etc.

I'm happy with the BC-890. I didn't expect it to be the best scanner in the world. I did my homework before buying it, so I wasn't too surprised at getting some images from the aircraft band, and intermod from some pager transmitters a few miles away.

The CTCSS option is a great feature, and the 890 has numerous other handy features. Mine certainly isn't used as a primary, high-performance receiver, but it works well from 30-900MHz using a Dressler active antenna mounted in the attic of a standard two-story house in a suburban environment.

2317. Pro 2035 vs 2042

Newsgroup: rec.radio.scanner
Date: 1996-10-25 00:00:00 UTC
From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <32709B52.41C6@vnet.ibm.com>
Source record: 219409

Since Radio Shack has discontinued the Pro-2035 and
selling them at discount prices(~$250), there seems
to have been a number of people interested in the 2035
but wondering how it differs from the 2042. I ran
across the following in Monitoring Times(Jan '96) and
it is a list of the improvements in the 2042 :

1. Tuning speed, when using rotary knob, increased by
a factor of three.
2. Empty memory channels(freq=0.0) are automatically
skipped during scanning
3. Up to 200 frequencies can be locked out in search
4. Duplicate frequencies are not stored while using
the Auto-Store feature
5. Attempted duplicate frequency programming(putting
in a frequency which exists in another channel)
generates an alert so user can cancel entry or
ignore the alert.
6. Frequencies within a bank can be sorted in
ascending or descending order.
7. Amber backlight for better display contrast.(I'm
unsure of this since my 2042 has a green backlight!)

Strong signals,
Rich Wells

Source record: 219411

Nothing's "wrong" with Pop'Comm - we're feeling the same pinch that all other pubs/businesses in our hobby are currently experiencing. Times have been tough, but they're getting better, AND NO ONE is getting "screwed" by us. Every once in a while there will be a case of someone's magazine not arriving - a postal problem! Or in other rare cases there will be a case of an actual subscription problem. Anyone who has been on our planet more than a couple of months knows (without the benefit of the wonderful internet droppings) that it isn't a perfect world and every once in a while there's a glitch, but it isn't something that can't be dealt with in a professional business manner.

Please note that I said a sub PROBLEM and not an attempt at taking readers for a ride. Folks should, as one internet respondent put it, look for concrete evidence on the internet, which, as the writer said, hard to come by.

So, take this note for concrete "fact" that no one is being "porked" - let's stand tall and approach this subject as professional men and women, not pre-schoolers, folks!

Anyone with SPECIFIC subscription problems - should feel free to send me a personal email and we'll look into the problem. In the meantime those folks interested in subscribing to Pop'Comm should have no reservations about doing so. Thanks for reading this and for everyone's time.

Sincerely,
Harold Ort
Editor, Pop'Comm

I found a good web site with a link to a major airport comm and nav freq guide...

www.simuflite.com

Do not go to the link that says airports...that is airport web pages...but the comm and navaid link is terrific...

If you know the airport three letter code, all the info is right there...and since it is intended for pilots, then it is updated real often...

BTW...if you are visiting or doing business in Dallas and have time on your hands before a departure...they have a new observation area on the southeast end of the airport...follow the signs from the E. Airfield Rd. You get a terrific view of the east side of the airfield and if you are lucky, planes landing on 17L will taxi right by you...and if you have forgotten your scanner they have tower comms piped to a loudspeaker right there...

This afternoon after the skies cleared there was not an empty parking space out there...

just for your info...cleve

The dutch do in fact have older model cell phones in 450 range....
They also have the new digital phones, forgot what they are called,
but they're an abbreviation (Grin>)

The local affiliate of the Peacock network failed to strut it's feathers early Thursday morning October 10, 1996, due to a 5th alarm electrical fire. 30 Rockefeller Plaza, a 70 story brick class 1 construction measuring 190 x 200, is the building that houses the studios for WNBC TV.

The fire started in an electrical panel on the 10th floor and extended to the floors above and below via the electrical conduits. A heavy smoke condition in the upper floors necessitated the evacuation of the entire building and transmission of additional alarms for manpower. The 4th alarm was transmitted 61 minutes into the fire.

A total of 26 engines, 21 ladders, 3 rescues, 11 battalion chiefs, 2 deputy chiefs, and a multitude of special units were assigned to the blaze before it was brought under control 4 hours and 15 minutes later.

When major fires require more alarms than the Starfire CADS can transmit, the additional units are special called. The alarm count is then the number of engines (not including engines assigned with special units such as the maxi-water satellites) divided by 4. Such fire are usually referred to as 5th alarms, but current trends have been to call them what they actually are. In this case, a 6th alarm with 2 additional engines.

After the 5th alarm was transmitted, an apparatus staging area was set up at the quarters of Engine 54 on 8th Avenue & 49th Street. The outer boroughs supplied Manhattan with units so that additional pieces of apparatus didn't have to come from greater and greater distances, and allowed Manhattan to preserve fire protection for the remainder of the borough.

They always knew that E/F was very much a non-secure circuit (save for use of STU-IIIs on it over the past couple years) monitored by thousands of citizens, spies, and worst of all, THE MEDIA all over the USA. One very wealthy hobbyist even paid for remote receive sites located at/near E/F ground sites, so he could monitor both sides of all E/F traffic years ago, and this was known to WHCA.

The problem is/was that some of the people using that circuit just couldn't get it through their thick but empty skulls that it was a non-secure circuit using a standard, well-known radio frequency pair! Classified traffic would occasionally go out over it until the aircraft radio or CROWN operator quickly cut it off, or some clowns would try to 'talk-around' classified traffic...

Current E/F traffic levels depend on what aircraft is being used, where the aircraft is (including altitude -- E/F is far from having "NATIONWIDE" coverage), & of course the traffic needing to be passed.

Satellite-based systems these days have helped make the E/F network an old, semi-obsolete (mostly obsolete except for being a redundant circuit) analog-based system that they often have trouble securing (via STU-IIIs) & costs WHCA a couple million dollars a year to maintain.

Yet this Spring, I caught Hitlary (aboard E1F in my area) talking to (yes, talking *to*, not talking WITH) Bill (aboard AF1 in CA) on it.

So I wouldn't exactly take that freq out of my scanners just yet -- but maybe sometime in the next couple of years.

Tim

Hi All,

Thanks for all the replies to my Toys R US Cordless Phone question that I posted last week.

The Toys R US stores that operate in the 457 Mhz range have phones that look like Cell phones with a 2 inch rubber duck type antenna. This appears to be a 2 channel system. One phone operates on 457.5375 and the other on 457.5875.

Base Unit Hand Unit

457.5375 468.6625
457.5875 468.7625

The Toys R US stores that operate in the 30-35 Mhz range have a headset like the ones used at Fast Food drive-thrus.

Base Headset

30.8400 154.5700
33.1600 154.5150

From: mikenet@access.usa.net
Message-ID: <54ulvb$m71@earth.usa.net>
Source record: 219128

I recently had a Diamond D130J discone installed on my tower. After the installer had left I noticed that one of the long metal elements that points down towards the ground had been bent upward so it is in a horizontal position.

Will this affect the antenna very much? It seems to work pretty well. Would it be best to just leave it alone? I thought if it was bent back downward it might break off.

The antenna is not used for transmitting.

Thanks.....Mike

I just bought a new one about a month ago and I think it's great. I was going to get a Bearcat 9000, then I saw Radio Shack had a sale on the pro-2036, at 169.$ it was about 200. $ less than the BC-9000 and looks identical to it. It has all the features I wanted except the alpha-numeric display. Even the optional CTCSS board costs substancially less than the same board for the bearcat. I was suprised when I opened the scanner to install the board, and saw the pro-2036 is actually made by Uniden. In my opinion it was a very good deal. I would like to find out what, if any, mods can be done to it. I have also bought a pro-2006 due to the extensive mods that can be done to it. Still considering the Bc-9000 also. Does anyone know if there is a Radio Shack clone of the BC-9000 ?

I picked on of these Pro-2036 scans up at RS too. Price was good at
$125. Question is does this model, since it is an Uniden, have a 800 mhz
cellular modification? An info or diagram would be appreciated. Tks..

Is there anyway to increase it's AM radio pickup capabilities? I want one of these honey's, and I love driving around at night trying to pick up far away a.m. stations. I live in Minneapolis and regularily get 670 a.m. from Chicago, WMAQ from Denver and also something on 1100, 1110, and 1160.

I'd love to be able to use the scanner to scan these channels instead of hitting the buttons on my radio when it gets staticky.

No chris I dont think so.
I was disappointed as well, the Specially made ferrite rod antenna
for medium wave reception, is quite bluntly a waste of time.
I think its a case of ... if you want am reception (broadcast band)
buy a specific radio.. the ar8000 is great for civil
air/mil/police/utilities/cellular and of course the computer control

I think the icon r10 (i think thats the name) which is out soon and
does the same as the 8000 will give it a run for its money

> not pre-schoolers, folks!

The specific allegation was that PopComm is "porking" writers, not its
subscribers. You don't address that issue at all.

I would certainly agree that the economy, and a low-dollar volume business
(scanners) would make advertising dollars tough to come by. The one thing
that you don't mention is the role that editorial plays in attracting
subscribers (thereby attracting ad dollars). That omission is telling, I
think.

I used to subscribe to PopComm, but I stopped. The reasons are: too many
articles geared to stroking advertisers, and too few articles covering
scanners and related stuff.

I really didn't care for all of the "back-when-radio-was-shortwave-in-Cuba"
stuff that is your primary editorial focus. I wanted then, and now,
trustworthy head-to-head product comparisons, new products, product
roundups, features about new technologies, how-to tricks/shortcuts/hacks
and other useful stuff. Scanners, and shortwave, too (I don't own one, but
it would never occur to me to read PopComm to find out which SW radio I
should buy).

For what it's worth, I used to subscribe to MT too. No longer. Basically
for the same reasons.

Has anyone done the PRO-2005 speed mod. I have read two ways of doing it.
One is to add a diode to D501 but I've recently read that if you clip
D503, it has the same effect. True? SOunds a lot easier.
Any tips on adding a faster X-tal?

The local affiliate of the Peacock network failed to strut it's feathers early Thursday morning October 10, 1996, due to a 5th alarm electrical fire. 30 Rockefeller Plaza, a 70 story brick class 1 construction measuring 190 x 200, is the building that houses the studios for WNBC TV.

The fire started in an electrical panel on the 10th floor and extended to the floors above and below via the electrical conduits. A heavy smoke condition in the upper floors necessitated the evacuation of the entire building and transmission of additional alarms for manpower. The 4th alarm was transmitted 61 minutes into the fire.

A total of 26 engines, 21 ladders, 3 rescues, 11 battalion chiefs, 2 deputy chiefs, and a multitude of special units were assigned to the blaze before it was brought under control 4 hours and 15 minutes later.

When major fires require more alarms than the Starfire CADS can transmit, the additional units are special called. The alarm count is then the number of engines (not including engines assigned with special units such as the maxi-water satellites) divided by 4. Such fire are usually referred to as 5th alarms, but current trends have been to call them what they actually are. In this case, a 6th alarm with 2 additional engines.

After the 5th alarm was transmitted, an apparatus staging area was set up at the quarters of Engine 54 on 8th Avenue & 49th Street. The outer boroughs supplied Manhattan with units so that additional pieces of apparatus didn't have to come from greater and greater distances, and allowed Manhattan to preserve fire protection for the remainder of the borough.

Questions from a newby regarding scanners. I can get a PRO 2037 for $179 and am trying to see if this is a good deal. What other scanners are on the market that have the same basic functionality? I want a scanner for a couple of hundred but would like the most I can get for my money. The last time I used scanners the choice was which crystals to put in the eight available slots.

Hey Scan Mod,

I just pick up tonight, a used RS pro-2036 and it is made by Uniden
for the Radio Shack in the Phillipines.

It is the exact Uniden scanner Bearcat 890xlt and is almost the same
as the BC 9000xlt but the bc 890 is NOT triple coversion. I love the
rotoray knob.

If you get any information concerning this scanner and mods please
pass it on to the newsgroup for all to see. Thanx

Good scanning makes good friends,

Mike

writes:

>The back of the 2006 says 13.8
>volt. I haven't seen one exactly 13.8 volt. HELP! -Scott

The reason that it say 13.8 volts is because it is rated to handle a
direct load from the automobile battery, either from the cigarette lighter
or a dedicated circuit.

Automobiles' voltage changes drastically due to accessories and the rate
of recharge from the alternator. Sometimes as high as 17 volts due to
overcharge, and sometimes as low as 10.5 volts.

Therefore, the scanners which are suggested by the manufacturer to be
capable of mobile use usually put a 13.8V rating to assure the consumer
that connecting this item to their car is a possibility.

If you decide to use a wall-wart, then a regulated wall-wart at 12V rating
(with enough amperage) will do just fine.

If you want to use the scanner in your car, then use either the direct
cigarette lighter cord, or wire a line to the fuse box. Please use a
....3A (?) in-line fuse. Someone correct me if this is otherwise. Also I
would suggest a electrical noise filter (usually found at sound-stores,
and use the one for a stereo head unit).

I too have found the same Chris, I was so flagged off at paying out
good money and not getting the anticipated performance!

I won't slag off any particular offering, but I was so disapointed
that I decided to do a new Windows package for the AR8000. It will be
available for the AR2700 but not just as yet.

The programme, CHANNEL COMMANDER V2.00 is under beta test NOW and a
few routines are to be finished.

I have created a TRY before BUY system. A fully featured demo version
will be lodged in a web server soon. The demo version will be the full
package and will do everything that the registered version will do,
except that the demo version times out after 15 minutes but can be
restarted for further 15 mins etc etc. This way, you can fully
appraise the features, quality, and usefullness before parting with a
penny. (Planned upgrades will be free of charge other than covering
cost of disk/postage if not emailed.)

(Any data generated via the demo version is automatically picked up
and used by the registered version)

I will keep you posted as to when and where the web site is for you to
download a copy of CHANNEL COMMANDER V2.00 as soon as I have more
specific details.

Another AR8000 (AR27000 potential) software is also very nearly ready
for release: "CONTROL 8000" This will also be on the web soon. This
will also be ideal for people with visual disability (Big buttons &
Big Freq displays etc. Again I will let you know its availability
site/sites nearer the time

>Am I doing something wrong?

No. This is normal. There is limited real estate inside for parts
placement, and the medium wave rod rod antenna ended up too close to the
CPU, whose noise it picks up.

I use:

Search - 869.04 Mhz to 893.93 Mhz step 30 Khz mode FM
You will find a couple of control frequencies which you can just lock
out. This is the TX band of 832 channels, I never found activity on
the Rx band (824.04Mhz to 848.97Mhz Same other stuff)

870-880Mhz is Cantel and 880-890 is Bell Mobility.
The one unexpected thing about this is that you can find out the
'quality' of the 2 systems ... more Cantel subscribers complain about
signal quality being bad ... hmmmmm ... maybe thats just because there
are MORE Cantel subscribers ... how about that, insights just by
typing it ... :-)

Ft. Lauderdale airport has their tower and ground freqs. on little signs at both ends of the runway. I don't know if this is common at all airports but you may want to take a ride out to the airport and check it out maybe bring some binoculars if the runways are not close to a road, plus this could help you get familiar with the airports layout this helps when listening to the ground freq.

Just a suggestion.....hope it helps.

Press FCN-0 (set) while scanning until the inverse "B" in the upper right
hand corner of the display is on continuously. Then repeat this while
doing a search.

This is covered on page 38 of the manual.

: I think its a case of ... if you want am reception (broadcast band)
: buy a specific radio.. the ar8000 is great for civil
: air/mil/police/utilities/cellular and of course the computer control

Just get a GE Superradio III for about 1/10 the cost of the AR8000. No one really gets a scanner to listen to the AM broadcast band, do they?

2378. NEW PRO-2046 Mobile Scanner

Newsgroup: rec.radio.scanner
Date: 1996-10-26 00:00:00 UTC
From: Bill Crocker <billc@rust.net>
Message-ID: <01bbc373$1e523520$7050c7cd@billc>
Source record: 219296

I just picked up one of Radio Shacks new mobile scanners...

PRO-2046 (Cat #20-149)
29-54MHz, 108-136.9750MHz (AM), 137-174MHz, 406-512MHz, 806-823.9375MHz,
851-868.9375MHz, 896.1125-956.0000MHz (Cellular Blocked, and probably not
restorable)
Preprogrammed bands: POLICE FIRE-EMG, DOT (department of transportation),
HWY, PUBLIC SVC, and WEATHER
Frequency display: 000.0000
Hyperscan: scan 50 channels per second
Hypersearch: search up to 300 steps per second
Data Skip
Weather Band Key
Ten Channel-Storage Banks
Ten Monitor Memories
Ten Priority Channels
Nine Frequency Bands
Two Frequency Band Search Options
Frequency Skip
Two-Second Channel Scan/Search Delay
Key Confirmation Tones
Memory Backup (14 days with no power)
Lock-Out Function
Squelch Control
Backlit Display
Supplied with 12VDC cable for car installation, requires optional
(#273-1652C) A.C. adapter.
BNC antenna jack, external speaker jack, mounting bracket, and manual.

This unit is on sale through the end of this month, October-96, for
$199.00. It has a very nice look and feel. Controls are laid out nicely,
display is amber. More on performance later!

2379. PRO-34 Frequency mod pointers needed!

Newsgroup: rec.radio.scanner
Date: 1996-10-26 00:00:00 UTC
From: JazzMan <see_my_sig@for.info>
Message-ID: <32727E5F.2276@for.info>
Source record: 219297

I searched altavista for info on modifying the PRO-34 800mhz band,
to no avail. Does anyone here have any pointers on where to look?
I've got the service manual which indicates some differences between
the US and Canada version, but it doesn't specifically say how to
convert the PRO-34 to the Canadian specs. Also, I tried to go to
http://ourworld.compuserve.com/homepages/bcheek
but Netscape doesn't like that address and gives me an error message.
Any info would be appreciated! JazzMan

123.500 was what they were using during the fire. They're back at Van
Nuys now, only the county ships are out on the fire now. That skycrane
costs a fortune to fly, they have a $2,000 reposistion fee for just
starting the engine and it's something like $8,000 an hour to fly.

I just received an older looking model Pro-38 Realistic scanner. While everything appears to work, I don't get any radio transmissions. I've tried a number of freq's that I know are busy. All I get is an occassional beep from the speaker.
Is this unit worth fixing? I just need a scanner for a specific purpose, to monitor a group of freq's in the 46-49 range. ANY input would be greatly appreciated.

> recommend it. I bought mine at Ham Radio Outlet.

I second the motion entirely! I own 2 2006s, a 43, other radios and the
FT50R. The FT50R kicks butt!
Drawbacks:
100 memory channels no banks
complicated lock-out

Reasons to have one:
Transmits!!! Modifiable for FRS GMRS Biz bands and APCO bands (I
don't advise this)
Receives 76-200mhz 300-540mhz 590-999mhz (cellular blocked- latest
versions not restorable)
CTCSS decode with FTT12 keypad
DTMF Decode
Record and Playback on/off air with FTT12 Keypad
Computer progamability
$400 w/FTT12 $339 without can be found cheaper
Many, many, many other reasons

For a full review including quantitative test results,
see my column in October 1996 Monitoring Times.

Summary from the FAQ "Buying a Used Scanner:"

PRO-2046: 1996 vintage 100 channel mobile made by Uniden
with fairly good performance. Descendent of the BC760XLT
but no CTCSS option available. Ten banks of ten channels.
Scans memory at about 34 channels/sec. Service search,
direct search, and band search. Preset search limits by
band and user cannot program the search limits. Image
rejection is minimal, as one would expect from a scanner
with IFs of 10.85 and 0.450 MHz. 10 Monitor memory
channels. Can lock out up to 20 channels from a search.

Hi Tim,

I checked two stores in MD and one in Northern VA and found
the following:

In Rockville and Wheaton, MD

The Toys R US stores that operate in the 457 Mhz range
have phones that look like Cell phones with a 2 inch
rubber duck type antenna. This appears to be a 2 channel
system. One phone operates on 457.5375 and the other on
457.5875.

Base Unit Hand Unit

457.5375 468.6625
457.5875 468.7625

In Tysons Corner, VA

The Toys R US stores that operate in the 30-35 Mhz range
have a headset like the ones used at Fast Food drive-thrus.

Base Headset

30.8400 154.5700
33.1600 154.5150

: should it be better. Reception is really crappy on BCB and noisy.

Remember, the AR8000 has an internal ferrite bar antenna which is used
for the AM broadcast band, actually, it is used for anything you tune to
which is below 2Mhz. I might be stating the obvious, but with this type
of antenna, you need to rotate the radio until you get the best
reception.

You have to get to the bottom board and clip D-11. It involves some soldering to get to the board (antenna ground), but it can be fairly easily done.

Recently bought an AR8000 and I must admit its good.
Its got so many things you can do that after 3 weeks i'm still
referring to the manual.
Computer control is brilliant.
Now to the important bits......Reception.

1. Its supposed to have a ferrite rod in, to make am stations better.
.....If i ever hear one I will let you know.

2. Reception using a lead pencil is better than the supplied aerial.

3. Breakthrough on the Civil Air band 118-132 Mhz.
I thought this was because I was using a discone. Its certainly
noisier with the discone but still audible when using a vhf rubber
duck.

4. Audio clipping on cellular when someone shouts.
This is the one radio where this has been a problem.
I have/have had AR800/AR900/AR2000/AR3000A
Aor say its a choice of Sat tone or clipping... funny my AR800
suffered from neither !

Comments Welcome
Apart from the "Well why not sell it then" type thanks !

Sid

>
> Bingo, Dave!

I'm sorry, but nobody goes into the magazine publishing business expecting to make big bucks in a hurry. If you knew anything about the magazine business, you would know that this statement is completely without foundation. Magazines are notorious money losers. Probably 9 out of 10 fail within the first couple of years (you can't even begin to count the number of computer magazines that have come and gone in the past 3-4 four years, for example). Take Sports Illustrated for instance. That magazine lost money for 10 years running before turning a profit. Magazines also are very expensive to launch, especially on a national level. They are expensive to produce, at least in four color, and to market and distribute. Getting newsstand distribution is exceptionally difficult too. The competition is very fierce because shelf space is limited and there are many new publications trying to break in at any one time. Editorial talent is very expensive. Editors today make serious money--particularly on trade magazines that require specialized industry knowledge. Man, I could go on and on...

Um, aluminum goes for about $.30 a pound at a scrap yard. So I would
guesstimate that a gallon of these "pop" (soda here in the east) tabs
would be worth about $10-15.

You certainly proven expert at that. You should know if anybody.

So why you run like girly boy about smoking power supply and Micor? All sudden you be real quiet. Blake and others offer to swap credentials and you be real quiet. How come IMackey? You big asker of credentials but won't show yours. You chicken girly boy. Who this system you say you maintain? Is this another lie? Why you so quiet on these issue IJohn?

Larry Wilson

14 Days since IMACKEY refuse Blake to swap credentials.

I have an antenna about 15 or 20 ft AGL...hooked up to a Pro-2006.
I live about 25 miles east of LAX, 40 or 50 miles to the se of Catalina
and about 50 or 60 north of Oceanside. I can always hear LAX Tower,
Ground, Clearance Delivery and sometimes ATIS. I sometimes hear Burbank
ground coms. It just depends on the antenna, how long your coaxial cable
is, what quality it is, and how far you are from the station. But I
noticed a great difference with my 40 dollar antenna.

I'm looking for a part number for the small metal "spring" located on the bottom of a Uniden BC-100XLT handheld scanner that puts pressure on the battery pack to keep it in place. This is the same part as on the BC-200XLT as well.

Anyone with a part number, and a phone number for Uniden parts would be most helpful as I attempt to repair this scanner.

>make or price bracket?

Those figures are respectable. What they are telling you is that for 20 db of quieting, a 3 kHz deviation signal needs to be 0.6 uV in the frequency range of interest. Amateur gear is usually specified at the 12 db quieting level instead, so sensitivity figures look better, but anything near half a microvolt is a good number for 20 db quieting.

With no signal, you get noise output from the receiver (open the squelch between stations and listen). When a signal is present, what matters is the ratio of recovered audio to recovered noise audio. This is called SNR (Signal to Noise Ratio). Due to the FM threshold effect, SNR will be better than the carrier to noise ratio (for AM, SSB, or CW, CNR = SNR, but that's not true for FM above the threshold, it will do better). So sensitivity figures for FM receivers are specified at a certain level of "quieting", IE even an unmodulated FM carrier will suppress the noise. This amount of quieting is measured in db. 20 db is considered "full quieting" in FM communications work, IE the noise remaining negligibly affects intelligibility (20 db means the noise is 100 times weaker than the signal).

Sensitivity is measured in terms of the signal voltage appearing across the input impedance of the receiver. Traditionally that's 50 ohms. So the specification is telling you that you need 0.6 microvolts of signal at the receiver input to achieve the 20 db quieting level. That's pretty good, the typical FM broadcast receiver needs 2 uV or more for the same performance. Amateur equipment will typically specify something on the order of 0.2 uV as the sensitivity figure, but that will be for 12 db quieting, not for 20 db (12 db means the noise is only 16 times less than the signal).

A very important specification is missing, however. That's the
third order intercept point. To a large degree, that determines
how much "crud", IE undesired mixing products from strong nearby
signals, that will contaminate your desired signal. Also, there
is no specification for image response. These two factors are
important, usually more important than sensitivity, in determining
if a receiver is suitable. Many scanners suffer badly in both
departments due to their necessarily wide frequency range, and
manufacturers are often reluctant to put hard numbers to these
performance aspects of their equipment. About the only realistic
test you can do is to take the candidate receiver to your local
intermod alley and see how bad it is.

>Listening to VHF/UHF transmissions, the audio quality is not high, not as
>good as commercial broadcast FM. Is this due to bandwidth? Using Xandi
>Electronics' miniature crystal-controlled transmitter (143.775MHz) to
>transmit conversation to the scanner, the end result is not as clear as
>it could be. Would a different transmitter/scanner combination give
>better clarity, or would a different technology be necessary for improved
>fidelity?

Broadcast FM uses 75 kHz deviation while communications equipment
uses only 5 kHz deviation. This means that audio frequencies higher
than 5 kHz will have a modulation index less than 1, and will be
rather noisy in the communications radio, IE they lose the benefit
of the FM threshold effect. Thus the audio section of the radio is
typically tailored to roll off response at about 3 kHz. With FM
broadcast, the modulation index will still be 5 for 15 kHz audio,
so high frequency response is considerably improved by the large
value of deviation.

A Grade A coverage area FM broadcast signal offers 40 to 60 db of
quieting (60 db means the audio signal will be a million times
stronger than the noise) while a communications channel is satisfied
with 20 db (signal audio only 100 times stronger than the noise).
Frequency response and SNR of broadcast signals will thus typically
be significantly better than communications FM. But the cost paid
for that is much higher power levels required for transmission,
much higher signal levels required for receive, and much greater
spectral bandwidth consumed.

In addition, communcations equipment has its audio response tailored
for best intelligibility, not for best fidelity. The audio frequency
response is typically 300 to 3,000 Hz instead of the 20 to 15,000 Hz
of FM broadcast, and communications receivers are typically specified
for a THD (Total Harmonic Distortion) of 10%, which is gross by HiFi
standards. This is a major difference in fidelity. And of course
dynamic range is constrained by the SNR to a lesser value for typical
communications radio signal levels compared to typical broadcast signal
levels. A scanner is not a HiFi.

Still, if signal levels are strong, and you rework the audio
sections of the communications radio for better fidelity, you

can get quite good results with NBFM.

>out the cause of this exact phenomenon, at this exact point in time.
>Thank you all for your undivided attention. And I'll leave the light
>on for 'ya. Bye now! Yeah, yeah, yeah .. ..

The LAPD system is simulcast from several geographically seperated
transmitter sites at once. The signals from each transmiter have the
potential to reinforce each other when the signals are received in
phase and on exactly the same carrier frequency. This is the reason
simulcast systems are used to provide improved building penetration in
many systems.

However, if the signals differ slightly in frequency you will hear the
signals beating against each other like you described. If you are
closer to one site than another the signal from the closer site will
capture (8 to 12 dB ratio), If you are far outside of the coverage
area, the signals from one site to another may differ in the time
taken to travel from the transmitter to your receiver. RF signals

travel the speed of light 5.4 microseconds per mile. If the signal from one site arrives 125 microseconds later than another site the distortion can be quite severe. If the simulcast ystem is not properly designed the signals from the multiple sites can be destructive.

There are many other "problems" that simulcast systems present including the following:

All carrier frequencies must be closely locked together using high stability oscillators, Rubidium, WWVB, GPS.

Transmitter modulation (FM deviation etc) must be nearly identical from each transmitter.

Audio frequency response of the audio chain from the dispatch console and reciever voters must be nearly identical before transmission at each site.

Transmitter site separation must be within the maximum allowable for the modulation used. FM audio distorts at 125 microseconds, while high speed data distorts at lower transmitter site separations as a function of the baud rate.

FM capture ratio can overcome some of the phase delay problem but not all.

Two comments:

I hooked the AR8000 up to an external long-wire antenna, and the BCB reception got MUCH better. But it's still not as good as my desktop general-coverage shortwave receivers. Not that there's anything wrong with the AR8000, I wouldn't expect it to outperform a dedicated desktop radio. It is good to know that with a better antenna, the BCB reception is acceptable (for local stations, not DX)

Second, I don't think you would want to use a scanner for your DX listening to the various stations. On a scanner, the use of the "squelch" let's the radio skip stations with no signal present, and move onto the next channel or frequency. In listening to AM tranmissions, it's been my experience that I have to turn the squelch basically off to ensure proper reception. This eliminates, then, the ability for the radio to scan to the next frequency. There are some other better radios to accomplish what you want, though most are going to require some user intervention to scan to the next channel of reception. The hobby you are describing is called BCB DXing, and is very propular with a lot of people. Perhaps one of the best things you could ever do to improve your reception is to build (or buy) a BCB loop antenna, which is basically a big diamond shaped open box of antenna wire. With the loop antenna (which can be used indoors, next to your radio) you can turn the antenna to null (or reduce) the signal from one station, while increasing the recption of another station on the same frequency. It will also greatly increase the gain of the signal coming to your radio. You generally need to have a radio which will accept an externa antenna, though I think there are some companies which offer an inductive antenna accessory which doesn't require direct hook-up. (You'll always get better reception through the direct hook-up, though.)

Good luck with your searching. It's a ball to do...

Hello,
I just purchased a Pro-41 at a hamfest. It was SUPPOSED to be in good working condition... it is not. When you turn it on it simply beeps once and does nothing. no volume, squelch or keypad entries make any difference. I have tried changing the batteries and running it on 12vdc. No change..... It sounds like a microprocessor problem to me. Anyone know of a reset ??? I am also open to any other ideas. I assume it is the 1st cousin of the uniden bearcat 10 chqnnel handheld unit.

PRO-41 10 Channel Handheld scanner

Thanks for your help,

Would anybody happen to have any sources (other than the FCC of course) or information on DF equipment (including antennas)? I need a rig that will help me locate anything from 50Mhz up to 2.0Ghz with 1 degree resolution. I don't care what it costs, or where its made, but I need a source soon.

Also, any other source of information that is related to "DF" work would be great.

You don't think Walmat re-package's and sells returns you are deadly
wrong. Do you have any idea how much stuff would cost if the returns
were not resold!!!!! Walmart just has the proper re-packaging
equipment in the stock room to make it look new! Remember that!

Hi, if you have the volume control on the scanner set lower than you normally would, then the battery drain will be lower , beacuse you are driving the scanner's audio output amp less harder. But also remember that when using the fake cassette, you are also causing the motor, belts, and drive wheels in your car's stereo to get extra wear. Try looking for an audio transfer product that transmits on the FM Broadcast band instead.Then just set your car stereo to a blank FM channel.

Clough@javiaton.demon.co.uk (Jonathan Clough) wrote:

>The Commtel 203 is the same as the PRO-39.

Thanks for your help. Unfortunately, Tandy (Radio Shack) states
something else. Accoring to their reference page (at
http://support.tandy.com/2849.html) they mention the PRO-39 as follows
(under "Features"):

[QUOTED]
This Pro -39 covers the following bands:

30-50 MHz ..... VHF Lo
50-54 MHz..... 6-Meter Ham Band
108-136.975 MHz.....Aircraft (AM)
[/QUOTED]

My Commtel COM203 (manufactured by GRE) offers a frequency range
starting at 68 MHz. So, i.m.h.o., these scanners cannot be *exactly*
the same. Anyone that knows a solution to this?

Anyway, thanks very much for your kind reply, Jonathan!

Cross-posted to: rec.radio.scanner,alt.radio.scanner

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

FRS - Family Radio Service [95.627]

Ch	Freq	Ch	Freq
1	462.5625	8	467.5625
2	462.5875	9	467.5875
3	462.6125	10	467.6125
4	462.6375	11	467.6375
5	462.6625	12	467.6625
6	462.6875	13	467.6875
7	462.7125	14	467.7125

The FRS was adopted on 10 May 96 and will be authorized
by July 96. It uses FM with a peak deviation of +/- 2.5 kHz.
Maximum power is 0.5w.
Channels 1 - 7 are shared with GMRS.

Lindsay Reid (lreid@lreid.demon.co.uk) wrote:

: The best software I have found is Scan*Star from Signal Intelligence.

I received a demo of Scan*Star when I bought my scanner. I had tried it, but I didn't remember it so I've just gone away and installed it again.

Americans are strange people. Many of them, and programmers seem to especially suffer from this, think that the world stretches from Hawaii to New York ... they appear to forget that there are millions of people elsewhere in the world who watch TV, buy products ... and use scanner software. (This is the reason why CNN international carries so much US political and other news... like we really care about it ...)

When I installed the Scan*Star demo, it produced a dialog box to ask me for my time zone. I am in New Zealand, we are currently in daylight (summer) time [NZDT = UTC+13] - so I entered NZST as the standard zone, NZDT as the summer zone and -12 as the UTC offset.

Now, my UTC offset right now is +13 (+12 for standard time). It is quite common for US software (like Scan*Star in this case) to get the sign the wrong way around, I don't know if its because y'all can't bear to be on the negative side of things ... or if the authors think that their market isn't smart enough to get it right.

So, biting the bullet, I entered my UTC offset as -12 (there was an example there for CET which is really UTC+1, being entered as -1). Scan*Star wouldn't accept an offset less than zero, contrary to the example on the dialog box. That also meant it wasn't capable of accepting my time zone.

It took me 90 seconds to get that far, and I discarded Scan*Star as yet another piece of poorly written software. (Heck, even ScanCat got further than that!!!)

As an aside, I really don't feel that a Windows interface adds much to a scanner control program. All the windows interfaces I've seen, including Scan*Star (if I recall it correctly) are fairly ugly/clumsy - you don't gain anything from the windows interface. Besides, the machine I use for this purpose isn't geared for Windows (it'll run 3.11 'ok", but I wouldn't try 95 on it).

Why can't we just have an *effective* text-based scanner control program. Simple, fast, effective? Forget the pretty windows and the like. It's not that hard to do!

: The software drives a number of Icom, AOR etc. receivers but no
: drivers are available yet for the Icom 8500 or the AOR AR5000.

Well, I've already started coding my scanner control program. The biggest disadvantage I have is that I only own two computer-controllable radios - my Kenwood R5000 and my AOR AR8000. So I'm going to turn that disadvantage into an advantage ... instead of hard-coding the support for each radio into the program, I'm designing it so that any (knowledgable) user can configure the thing to work with any radio. Then of course they could send the config files to me, and I'll release support for that device next time around ...

(Well, I spose I'd better stop talking about it and start doing it. :-)

Hi Tristron,

I doubt that it will drain the batteries faster. If anything it may
make them last a wee bit longer but I very much doubt if you will
notice the difference, one way or the other.

>Shack would be gone!

Could it have been a situation where the salesman had opened the package for the softpack for a previous customer, to see if it fit his unit? Could it have been that it didn't fit, and the packaging was damaged, so it had to have a new "header" stapled on it when it was put back? Could this entire scenario have taken place because the salesman was gracious enough to allow the previous customer to try it in the store so he wouldn't have to bring it all the way back if it didn't work? Or, could it have been that the customer bought it, took it out to his car, tried it and found it didn't fit and brought it back in? Perhaps the customer (who in this case would have to be called a "customer-droid,") tore the packaging up so that a new header had to be fashioned for it? I'll would venture to say that if YOU had brought the item back in the above situation, and the salesman said he couldn't refund it because the packaging was destroyed, you would have screamed "The thing is BRAND NEW! There is NOTHING wrong with it!" Then the salesman would have made the refund, put a new header on it, and the next customer would have come in and screamed "This thing is USED! There MUST be something wrong with it!"

There would be a lot of people complaining here if they had waltzed into a RS, asked to try the softpack to see if it would fit, but were refused the opportunity because the salesman said "No...it will damage the packaging, and if it doesn't fit I will have to put a new header on it. Putting a new header on it will make future customers upset." I can hear it now..."Darn salesdroids won't let you open up a package to try something out! They are idiots!"

Have any of you ever tried on a pair of trousers or shoes, found that they did not fit, and had the clerk put them back on the shelf? (That's why they have fitting rooms in stores.) Have you or your wife (husband...don't want to be sexist here!!!) taken some item of clothing home and returned it? How about a new car? Do you think the 100 or so miles on the odometer are put on by the guy driving it from the factory to the transport truck? How about the book in the book store? Has anyone leafed through the pages before you?

For what it's worth, I have been trading at my local RS since 1978, with the same manager (gotta be a record!!) and when I buy a new scanner I have him put it on the display shelf 3-4 days. Even though few scanners don't work out of the box, I like to have mine "burnt in" before I get it home. It often has a scratch or two from the "customer-droids" that don't know how to handle equipment, but I don't mind. Could you consider that a "used" scanner? I don't know...you make the call.

The reply to this post will no doubt be a cry that ALL RS stores simply repackage ALL returns and sell them as new. "I saw it happen before my own eyes!" "I bought a new stereo system and it had holes drilled in the case and the speakers were blown!" "I bought a new scanner and there was only a brick in the box!" To those folks, I say simply don't go to RS anymore.

I agree that if I purchased a radio (or numerous other types of equipment, items,) and it was obviously used and scratched, I would be upset...but a softpack in a package with a restapled header???

2446. WTB: Realistic PRO-30 In Non-Working Condition

You can go to uttp://www.airmail.net/dpd/com_code.txt for a list of
channels,
their frequencies and what the channels are used for. All of these are
being
broadcast.
It is operating just like a regular scanner. When Channel 1 (Central
Patrol)
is not being used then it goes over to Channel 2 (Northeast Patrol). It
then
stops when someone is talking.

2451. Re: Spectrum Band Range Terminology

Newsgroup: rec.radio.scanner
Date: 1996-10-27 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <54v53o$aad@hopper.acm.ORG>
Source record: 219174
Cross-posted to: rec.radio.scanner,alt.radio.scanner

brpeter@ix.netcom.com (Brian Petersen) asked:
> ... the frequency ranges for the ELF and VLF bands.
> ... what are the ranges for the Longwave, Mediumwave, and Shortwave bands

As defined by international treaty, currently the "Radio Regulations"
(Geneva, 1982), the designations for the bands are:

```
Freq. 30kHz 300kHz 3MHZ 30MHz 300MHz 3GHz 30GHz
VLF | LF | MF | HF | VHF | UHF | SHF | EHF
| | | | | | |
Band <--4----|---5----|---6----|---7----|----8----|----9---|---10---|---11-->
| | | | | | |
Wave- | lw | mw | sw | | | |
length 10km 1000m 100m 10m 1m 10cm 1cm
```

After using up the adjectives very/ultra/super/extremely, they gave up and
band 12 (300-3000 GHz) has no name. The bands below 9 kHz (the lowest freq.
subject to treaty) are usually refered to as ELF.

Geez, the 3000XLT is a power scanner. It's got the Twin Turbo system that scans VHF at an amazing 100CPS. Full coverage except cell (25MHz-1.3GHz). It's a great portable. The BC200XLT is a great scanner but doesn't compare to the 3000XLT. If you have the cash, the 3000XLT.

2456. 2006/PRO34 speed mod

Newsgroup: rec.radio.scanner
Date: 1996-10-27 00:00:00 UTC
From: "Scott A. Nelson" <scottnel@iw.net>
Message-ID: <3273B0FE.3923@iw.net>
Source record: 219179

A few years ago I tried to modify mt PRO34 for increased scanning speed. The mod worked fine- it increased scanning speed, but it would never stop on anything! The NOAA wx wouldn't even stop it. I then decided that it would be better to slow it back down. I did and it works fine.
My question is this. I also have a PRO2006 and have thought about doing this mod, but have never done so based on my previous experience. Has anyone else ever had this problem? Are you satisfied with your 2006 speed modification? Thanks in advance.

That's easier than I had expected! The manual lists different values for
several components, plus the addition of a choke on the antenna ground and
three resistors (R801, R802, R803). Will I need to do any tuning after clipping
D11, or will I be up and running right away? Thanks for your quick reply to
my earlier post, Phil!

I'm just curious how this works. You buy a scanner from a manager you've known for 18 years and then you have him set it up in the store for several days so it can "burn in". Then, after several customers have fiddled with the knobs and handled it, you return to pick it up and take it home with scratches and all. Did I get that right? If so, when you buy a car, do you do the same? I'd just like to know more about this thought process.

Thanks,
Steve S.

2461. Re: AOR 8000 and Broadcast Band?

Newsgroup: rec.radio.scanner
Date: 1996-10-27 00:00:00 UTC
From: Gary Wilburn <ni8k@one.net>
Message-ID: <32739F55.4A96@one.net>
Source record: 219184

Bill:
Stick with the car radio for AM broadcast band. The aor 8000 is
great for VHF/UHF scanning and does an ok job on strong shortwave
stations if you have an external antenna.
But if you are out in the woods and no other am radio is near, then
the 8000 might bring in that distant station if you connect an external
antenna. The built in am antenna on the 8000 is at best poor. Here in
Cincinnati we have WLW, 50,000 watts clear channel and it barely comes
in on the 8000.(Sounds like a $10.00 China clock radio with the antenna
disconnected)
Remember, a radio that tries to be everything to everybody ends up
pleasing no one. I have had my 8000 for about a year. When I want a
portable scanner for my favorite 300 vhf/uhf frequencies the bearcat
bc3000 is my favorite and a much better scanner than the 8000.
When I want portable shortwave the sony 2010 or ATS818 are about 50
times better than the 8000. And when I want good portable am dx the GE
super radio III under $50. is hard to beat or the 2010.
On the other hand if you are driving around at night, that good
car radio with a decent antenna will probably beat them all !
The aor 8000 is good for searching out new vhf/uhf frequencies from
a portable location. You can load in your favorite frequencies from the
computer if you buy or make an interface then spend around $100 for
software. (I have done that). So the 8000 sits on the desk and does not
get used. But if it was all I had.....

> What good is a radio with only 0.5 watts of power? Better to use CB.
>
>
These radios are basically used portable use. The advantanges of FRS
radios in comparison to cb radios are a smaller antenna, smaller units,
frequency used, and type of radio transmissions.

1. The basic antenna size for good communications is 1/4 wave.
CB 1/4 wave 102"
FRS 1/4 wave 6"
Even if you have a portable cb radio, the range is very limited.

2. FRS radios are slightly smaller that protable cb radios but not worth
debating.

3. Everyone knows 27 Mhz for cb and 462 Mhz. The uhf frequencies can
transmit through building clearer than the cb.

4. Types of transmissions: FM vs AM.

Basically the differences are a personal chaoice. Luckily I don't used
FRS radio. I am a licensed GMRS users which I can use up to 50 atts mobile
radio or communicate through a repeater. I contacted a repeated a little
over 20 miles.

1st introduced.

Version 1.1
Added: Game mode, Changed High Power Mod to "Internal System Alignment". In this section I also detail the squelch and S-meter

adjustments. Also added info to the bug on the FTT-12 Keypad.

Introduction
The Yaesu FT-50 is perhaps the most unique VHF/UHF Handheld manufactured today. Itï¿½s made to MIL-SPEC 810, for dust, splashproofness, and vibration. Out of the box, it has not only dual band 2m/440 capability, but wide FM receive and AM receive as well. In addition, it receives 76-200 MHz, 380-500 MHz, and 700-900 MHz (Cellular Blocked). It has one of the fastest scan speeds for an amateur HT. It also has the unique ability (w/ ADMS-1C software) to interface with an IBM PC running Windows and have memories and settings uploaded/downloaded. In addition, it has DCS (digital coded squelch), ARTS (auto-ranging transpond system), and Yaesuï¿½s excellent transmit and receive battery saver features. It also uses Yaesuï¿½s extremely efficent FET power module that allows for 5W+ of output power with a 9.6V battery pack. With the optional FTT-12 keypad, the unit also performs CTCSS decode, DTMF paging, and also incorporates a Digital Voice Recorder! All of this functionality in such a small package makes it my rig of choice.

Problems (Bugs)
Unfortunately, the FT-50 is plagued by a few bugs. None of them are very serious or life-threatening, just a bit annoying. First among them is its Wide-FM receive. Apparently Yaesu engineers didnï¿½t put a wide enough filter in the unit, and some of the bandwidth of broadcast FM signals gets "chopped off". This means that the rig is near useless for listening to music on the broadcast FM band. It works marginally with voice only on the same band. My opinion on this problem: If you want to listen to music, bring a small Walkman or other transistor radio with you. The ï¿½50 does an adequate job of bringing voice signals in on broadcast FM, so itï¿½s good for listening to emergency broadcasts.
The second "bug" lies in the optional FTT-12 keypad. The manual for the radio states that you can set up a "voice mail" type of functionality that lets your radio operate unattended and record calls for you. This mode doesnï¿½t work correctly, although the built-in voice recorder works great. It seems that the unit will playback the wrong voice partition. The problem appears to be in the DTMF page-answer-back area. If youï¿½re buying the ï¿½50 and FTT-12 solely for this purpose, DONï¿½T! It doesnï¿½t work and thereï¿½s no current workaround.
The third bug has been complained about a bit. It seems that some ï¿½50s suffer from a low Tx audio problem. This is due to a factory adjustment that is set a bit on the low side. It is easily fixed. (See Factory Adjustments below).
The fourth "bug" is synergistic with the ADMS-1C software. If there is some kind of problem in downloading a file to the radio, the software aborts with an error, and the rig is left with itï¿½s memories cleared in a "limbo" state. This state is actually the European band plan, and if done properly, the rig can be modified

to receive even more frequenciesï¿½ which will be described later. (See modification section) However, if you want to return the rig to its natural state, simply download a blank frequency file (NONAME.RDF) to the unit. All should be well.

Factory adjustments
If your rig suffers from the low Tx audio problem, hereï¿½s how to fix it.

1. Remove the battery and antenna.
2. Remove the "NiCd" sticker on the heat sink. If you remove it very carefully, itï¿½s possible to re-install it later with the same stickum thatï¿½s on it.
3. Look in the cavity where you removed the sticker. Proceeding from left to right, hereï¿½s what youï¿½ll seeï¿½
Phillips head Screw (Holds the keypad in)
Small Silver Potentiometer (VR1001ï¿½VHF Deviation Adjustment)
Small Silver Potentiometer (VR1002ï¿½UHF Deviation Adjustment)
Small White Potentiometer (TC1001ï¿½DONT TOUCH! CTCSS Tone Adjustment!!!)
Phillips head Screw (Holds the keypad in)
4. Take a small Phillips head Screwdriver and turn both VR1001 and VR1002 about 1/8 turn clockwise. This will increase the VHF and UHF deviation and fix the low Tx audio problem. If itï¿½s not enough Tx audio, simply turn both pots another 1/8 turn. Make sure to turn both pots the same amount!
5. Replace the NiCd sticker, battery, and antenna.
6. Youï¿½re Done!

Internal System Alignment (May not work on some radios)
NOTE: This setting appears to work on radios that have NO MEMORIES programmed. You might want to try STEP 3 before clearing your memories. If step 3 doesnï¿½t work, you probably need to clear your memories. BE CAREFUL with these settingsï¿½ itï¿½s possible to really mess the rig up by setting some funky squelch or somethingï¿½ you might want to write the default settings for your rig down.

1. Select 2m VFO frequency.
2. Turn the radio off.
3. Push LAMP, PTT, Knob, and PWR at the same time. The rig will turn on with the squelch open, so turn the volume down!
4. The ï¿½50 will display "BAND xxxxxx" where xxxx may differ depending on your radio and whatever mods you may have performed.
5. Turn the top knob. There are a variety of settings available. Here is a listing of them:
ï¿½ HSSQ: Squelch Hysteresis Adjustment, adjusted by the dial.
ï¿½ THSQ: Squelch Preset Threshold
ï¿½ TISQ: Squelch Preset Tight
ï¿½ S1LV: Low-Scale S-1 Adjustment.

ï¿½ S9LV: S-Meter Full Scale Adjustment.
ï¿½ HIPO: Hi Transmit Power Adjustment: Should be calibrated for 5W (Can be pushed higher with a 13.8V Supply)
ï¿½ L3PO: Level 3 Power Adjustment: Should be adjusted for 2.8W.
ï¿½ L2PO: Level 2 Power Adjustment: Should be adjusted for 1W.
ï¿½ L1PO: Level 1 Power Adjustment: Should be adjusted for .1W.
6. Select the adjustment you wish.
7. Push in the Top knob. There will be a "s" that appears next to the displayed number.
8. Rotate the knob to change the setting.
9. Change other settings, if desired.
10. Push the knob for more than 1 sec to save the profile.
11. Select 440 VFO frequency.
12. Repeat Steps 3-10 to adjust the UHF Settings. UHF Settings will have a "U" in front of them.

Modifications
The FT-50 is extremely easy to modify. The first modification is performed for you at the factoryï¿½ but for those of you who accidently disabled it, or changed itï¿½ here it is.

Extended U.S. Receive Mod (Expands receive from 144-148 & 430-450 to 76-200, 380-500, 800-999 ï¿½cell blockedï¿½) NOTE: All memories will be erased.
1. Turn the transceiver off.
2. Hold down the Knob and Lamp keys while powering the unit on.
3. The unit now has U.S. Extended Receive.

MARS/CAP mod (Extended Transmit Mod: app. 144-159, 420-470) NOTE: All memories will be erased.
Donï¿½t transmit on bands that youï¿½re not licensed for!! Besides being illegal, it creates problems for people using those frequencies.
1. Remove battery & antenna
2. Remove NiCd Sticker on Rear Heat Sink
3. Loosen (Donï¿½t Remove) Philips head screws on rear that hold keypad in.
4. Use screws as thumb holds to press keypad out.
5. Remove screws.
6. Remove Keypad.
7. Under Keypad on Left Side there is a series of Solder Jumpers. They are labeled in white from 1-3. Only #1 will have solder jumpering it. Remove the solder, being careful not to damage or touch any other components. WARNING: If youï¿½re not good at desoldering, or have shaky hands, you might want to have someone else do this for you. Itï¿½s REAL easy to damage the rig.
8. Reinstall Keypad. Be careful of the O-ring around the keypad. Make sure itï¿½s not twisted or damaged, as the waterproofness of the unit could be compromised.
9. Install sticker, battery and antenna.
10. Hold down Knob and Lamp keys while powering the unit on.

(Extended Receive Mod as above.)
11. Completed!

Super-Hyper Awesome Modï¿½ The mother of all Mods!!! (Requires
ADMS-1C software and MARS/CAP mod to be performed)
Receive: 76-999 Mhz (No displayable holes!!!)
Transmit: 120-221 Mhz, 320-499 Mhz (AGAIN, Donï¿½t transmit on
frequencies where youï¿½re not licensed)
NOTE: This mod will disable ARS (automatic repeater shift) and will
set 2m and 440 repeater offset to
weird numbers. Make sure you enter repeater offset and +-
shift manually. Repeater offset needs
be set once for the rig, then it should be able to be
forgotten about. It will also clear memories.
Remember above where I mentioned the ADMS-1C software having a bug?
Hereï¿½s where the enterprising and curious ham can take advantage
of that. This mod will install the European band plan in your
radioï¿½so without the MARS/CAP mod you will lose the top portion of
your 2m band.
1. Are there frequencies in your radio? Donï¿½t want to lose them?
Simply get the data from your radio as it sitsï¿½ you can "merge" the
frequencies later. Save the file.
2. Perform the MARS/CAP mod as outlined above. Get the data from
the mod and name it USA.RDF.
3. Attempt to send the same data to the radio. In the middle of
the transfer (around 50%), pull the adapter cable to the PC out of
the radio.
4. Thanks to the bug, your radio is now in European mode! Perform
the Extended Receive Mod by holding the Knob and Lamp keys down
while turning the unit on.
5. Now, the Automatic Repeater offset doesnï¿½t work. Thereï¿½s no
workaround. Note that the 2m offset has been changed to 0.00. Go
to the menu by holding down the knob. Go to SHFT, Option 7. Press
the knob. Turn the knob so that it reads 0.60. Press PTT.
6. Now, turn off the radio. Put it back into clone mode. Read the
data back from the radio to the PC and save the file as EURO.RDF.
7. If you want to enter frequencies manually or using ADMS as
normal, go ahead. Everything should work. If you saved
frequencies as above, open EURO.RDF and "merge" the frequencies
from your USA.RDF file into it, and save it as another name. Then
send the modified EURO.RDF (your filename) file back to the radio
using the "template" file EURO.RDF. Youï¿½re done!
8. To return the radio back to the U.S. band plan, send the USA.RDF
file back to it.
Note that I have no way of measuring the sensitivity of the
frequencies or the output power of the rig outside of the ham
bands. The 220 coverage seems to be very poor, however, the radio
does display 220 frequencies. It wonï¿½t transmit on our 220 bands,
though. 800 Mhz receive is vastly improved.

Game Mode
The FT-50R includes an interesting "game" thatï¿½s programmed into it. Hereï¿½s how it works:
1. Power up the radio while holding down the MR key. (PWR + MR).
2. The display will show GAME on the left side, and Spd 1 on the right. Youï¿½re in game mode!
3. By rotating the knob, you can change the speed of the game. Higher numbers are faster.
4. Press PTT to start the game.
5. Numbers will start to scroll across the screen from left-to-right. As they come, you are supposed to push the number on the keypad that makes a sum of ten, followed by F. Example: 6 appears, press 4, F. If 0 appears, enter 10 followed by F.
6. The game is over when the screen fills up with numbers.
7. To exit the game, simply cycle the power.

CORRECTION

The radio is a UHF radio. Asking price for the whole pkg. is US$ 600.00
OBO.

Sorry for the inconvenience.

Doug,

About a year ago I purchased submini 2.5mm mono jacks at Radio Shack(Radio Shack P/N 274-292). They are closed circuit jacks, so you have to modify the jack to be open circuit.

I don't have an AR2700, but have put several jacks on my AR8000. The real estate inside the AR8K is very "tight". None-the-less, with some *very careful* planning, you can install jacks on either side of the AR8K towards the bottom (below the power jack level), on the left side about the height of the <SRCH> key, or on the top of the AR8K between the "DIAL" and "VOL" silkscreen. There may be room to install a jack on top of the AR8K between the BNC and "SQ" silkscreen also. Be sure to check both halves of your 2700 for possible interference.

Like the Opto Scout manual suggests, I would recommend using only an exacto knife to create the holes. Unless you feel like drilling out some components in your 2700. :>(As always, any mods you perform are at *your own risk* and will void your warranty. If you don't feel comfortable with performing the mods, I would look for a competent local tech that someone recommends.

Hope that this helps,
Scott

>be lost!!!!

Although perhaps a touch condescending towards our friends who are newer to the hobby, this advice does nonetheless bring up a valid and often overlooked point. The AR scanners listed above are near top of the line and quite fully-featured, particularly the AR8000.

Regardless of the endeavor, fist-time entrants to a given hobby who jump in full throttle and get the most sophisticated tools of that hobby, unfortunately find themselve quickly disenchanted by the complexity or learning required. That's why parents who hunt may likely start their kid out on a simple and relatively harmless BB gun and not a 30-06 double barrel shotgun which will scare the crap out of the kid upon first firing.

I would encourage anyone with the money to get an AR8000, no questions asked because you will eventually get a lot out of it. However, I can recommend many units that present a much more straightforward and enjoyable experience to the newer scannist who may not yet feel entirely at home with using a scanner.

Enjoy regardless.

Mike

Alan, Sorry to tell you this, but the best speaker I've heard the PRO-43 drive is an 8" wide-range generic speaker from Rat Shack. I try to use the speaker in mine as little as possible. IT SOUNDS HORRIBLE. I dont' know what else you could put in there to get any better sound from. It's a really SMALL space for a speaker.

This may not matter now, but how did you hook it up? I use the earphone
jack and turn the volume to the 8 mark on the scanner. I set the bandwidth
to wide and the filter to "NR". I provides very clean sound. No hiss or
whine. I have noticed the "pipe" effect on some other types of
transmissions, but otherwise it performs very well.

Hi Sean,

The Target stores in MD and VA use the following:

467.8000
467.9250

The Target stores in Northern VA also use the following:

467.7625
469.0625

Unfortunately, no. I have tried this using what I thought was a clever sequence of MOVE's and COPY's from the scanner keypad, and would work on any bank to sort it in ascending frequency order, however, I invariably always had one or two that were still out of order. It drove me nuts, so I stopped trying to figure out a good way to do it. It involved writing down the channels in a bank and their frequencies, then sorting them on paper and going back and forth on the scanner.

Seems to me the only quick way to do it is to upload a bank in to a software program and re-sort, then download back into the radio.

This is indeed a feature that AOR should have put into this scanner. Perhaps even a sort alphabetically by alphanumeric tag (although scan speed would suffer).

Mike

I have used my 8000 to listen to MW and receive 850 - KOA out of Denver
with the internal antenna, and I am in Dallas! As well I can receive
several FAA Nav. signals in the 300 to 400 KHz area with little
difficulty. I have also received a lowfer station that is about 30 miles
from me on 184 KHz. Not bad considering the band coverage on this radio
and the internal antenna.
>
> 2. Reception using a lead pencil is better than the supplied aerial.I will agree, the
ducky leaves much to be desired, but since I am a ham I
use several of my other radios duckies to improve receive in what ever
portion of the frequency range I am wanting to listen too.

I am planning another trip to the Rachel, Nevada area for a
Radio scanning trip of Area 51. I have several ideas about
what I want to do and how to do it. I am looking for
someone with the time, equipment, and similar interests.
I do NOT plan on trying to get past the "cammo dudes",
and I do not plan on trying to peek into the restricted area.
This is a RADIO expedition. I have all of the related maps,
charts and quads, and will be using GPS as well as other
sophisticated radio and radio locating equipment. If anyone
is interested in joing me on this trip, please e-mail me at:
cheshire@ridgecrest.ca.us. I do NOT want any money
from you, and this is NOT a scam. I am planning to be
there in the mild weather of May, 1997.

2502. Ethics on monitoring cordless video.

Newsgroup: rec.radio.scanner
Date: 1996-10-28 00:00:00 UTC
From: schlemba@ix.netcom.com
Message-ID: <550ugg$ees@dfw-ixnews8.ix.netcom.com>
Source record: 218975

With the advent of new cordless video cameras for monitoring Junior in his crib, a whole new era of scanner (television) monitoring has dawned. Toys 'R Us is marketing two different cordless video systems. One operates on TV channel 58 I think. After this holiday season, when many parents put these new toys into use, I suspect some enterprising scanner/monitor enthusiast will buy a Radio Shack VU-225 or some such outdoor TV antenna and a rotor. After much searching around, this enthusiast may hit pay dirt; a constant video signal from a neighbor's master bedroom.

Should this monitoring opportunity be as illegal as phone monitoring?

Does this exceed the bounds of the listener's (watcher's) right to know?

I'd like to hear some opinions on this.

TIA,
Steve S.

In <3274482D.7F7@netvoyage.net> Wes Padilla <sky@netvoyage.net> writes:

>
>Why does everyone hate him?

Hi wes....capital w

It's not that everyone hates him? Very few have met him.(pun)

No one has met him seems to be those who go after him. Being
that he is in his senior years he's very well versed on matters
which the juveniles who do the most chattering about him are not
able to assimilate at one reading.

It's the war of the generations....his knowledge versus the
chest pounding of a few half-assed know-it-maybe's who are
upset that they cannot be as helpful as the Cheeks Guy is.

There are a lot of people who accept him and understand that
his contributions are valuable and topical.

Wes...someone got really upset that Bill used the P word.
All hell broke loose upon seeing that word in print and the
flaming began shortly after. Some IDIOT even has the audacity
to FLAME the Cheeks Guy using different addresses which no one
can answer back to or they are totally anonymous....and to boot
no one cares.

The word the Cheeks Guy used was : Poop. Yes, he used the word
POOPY too. Oh yes. This just made this Idiot Mackeyh go bonkers
and I guess he grew a new batch of KING ZITS on his posterior
sides....

Getting back to your query: Cheeks is not despised. He's not
even hated. He's got a loyal following in all areas of the
globe and for that he is subject of derision and scoffing by
people who just have no idea what it is the Checks Guy is
about.

These people go after him because he's EASY. He helps and he
don't take shit from any one who crosses him in the way that
the IDIOT MACKEY and a few others have. That too is reason
they HATE him...he don't take their shit.

Again, it's a case of the Cheeks Guy being in a generational
hang and the newer "no official generational designation" types
have their stupidity to bare for all of us to see.

That's it WES. They just have no conscience. No sense of one's history as the Cheeks Guy has. they resent him....they resent anyone who defends him. Or understands him.

Or gets along with him because he is an intelligent man.

Don't get too worked up about it. the Cheeks Guy ain't.

Steve,
In electronics there is something that Andy knows about and you don't.
It's commonly referred to as "infant failure syndrome".

The essence is this: with any given electronic component, if it
survives the first 24 hours of run time, it will probably run the next
100,000 hours without failure. This is not theory, but rather
statistical probability based on experience.

Therefore: What Andy is doing is very intelligent, and if I wasn't
always so eager to get my hands on a new "toy", I'd do the same.

Mark

The truth as I perceive it to be.
Your perception will be different.

I suspect you may have tried to go too far with your 34. It is
adviseable to not exceed 2X the original speed. I modded mine years
ago with no problem.

Mark

Phone wires are private property. The airwaves are not, and never will be. If you expect to have total privacy during radio communications, you're not too bright. Making monitoring illegal is the same as passing a law that says everyone has to wear earplugs when walking down the street (so they can't hear other people's conversations). The airwaves are a public place.Don't kid yourself about privacy.

There was a rumour flying around years ago that if a community or
group saved X amount of pop tops, they could trade them in on a
wheelchair. Seeing as the most expensive part of aluminum processing
is the electricity involved, (especially in these days of recycling),
I'd guess pop tops are a dime a pound. It would be cool if it were
true, though. I've got 2 - five gallon buckets full of beer caps, I'll
take offers!

>equipment! Every buy anything like a Sony Discman and try to get a
>replacement adapter for it? How about $40- $90 for a stupid adapter
>that you could get at RadioShack for $12-$20

You mean, the adapter which comes free with the Real Name equipment
the Shack sells as private label?

Back a few years ago, when the Sangean 803 was selling for $200 and
included headphones and an AC adapter, the DX-440, an 803 with the
nameplate swapped and the ac adapter jack reversed, was sold without
adapter and headphones for the same price.

Or the DX-360, also with a positive ground... or the Pro-34, also with
a positive ground... Why does Radio Shack see the need to switch most
of their equipment over to a positive ground, other than to sell wall warts
specifically "designed by Tandy"?

Granted, not all RS equipment has the reversed polarity... the pro-2004
doesn't... but then, that already came with a built in power supply, and
if they did reverse the 12v input, I'd bet they'd be getting a lot of heat
from the mobile instalations which short circuited.

Tandy is SLEEZE when it comes to "made exclusively for Tandy" crap, IMO.

First of all, it's not illegal to have a modified scanner, it's only illegal to *use* it to listen in on cellphones. The Cellular Security Groups openly advertises they mod scanners and they have been doing it for years. And also, do you expect the minimum-wage security types at the airport to even know what a scanner is, let alone a modified one. Don't worry.

Sid,

I think the question you are asking is where does the power come from? If you notice there are two schematics
in the diagrams found in the archive PD-203.zip, whcih can be found at
http://www.l0pht.com/radiophone/pager/pager.html.
The upper schematic, the one that contains the 741, is the demodulator. The lower schematic is the one that allows you to derive
power from your RS-232 connection. I believe the reason these are seperate diagrams is so you can supply the demodulator with
your own power source, so as not to put a load on your COM port.

Uniden UBC3000xlt scanner for sale!

-like new, in box with instructions
-has full cell. coverage!
-doesn't include AC adapter (you can use any 12v multi adapter, this is the European model and didnt' come with any power supply when I bought it new).

I bought this about 2 months ago for $410. and need to sell it due to car repairs.

I'd like to sell it for best offer (preferrably over $350.) I'm in the Los Angeles area and would prefer to sell it to someone local, who can pick it up, but I'd be willing to ship it if you pay the shipping costs etc...

Please e-mail if interested, thanks.

How are you going to do it without spending many $$$ to personally go there and do the deed?

It has been 5 days and I didn't see post one until tonight. So, why you now post this?

Also, it is duely noted that you have threatened (however indirectly) to use "hacker techniques" to cause problems with our machines. I think not. the internic security beureau takes a dim view of hackers (and "wannabe's").

My recommendation to you is, go back under that slimy rock and stew in your own juices. You brought this one on yourself, John boy and you are the one that is going to have to own up to it.

From: Scott Ryan <crtoy@fyiowa.infi.net>
Message-ID: <3274CF18.3EA@fyiowa.infi.net>
Source record: 219068

I'm currently using a tiny RS outdoor antenna for scanning with my RS PRO-2035. I was wondering if anyone has experience with the RS "All-band Ground Plane" (page 43, item #5 in the 1997 catalog)? Is there a chance it will out-perform my current RS antenna (#4 in the above mentioned catalog)?

The antenna will be mounted in the clear about 25 feet agl & feed with approx. 35' of Belden RG58 coax. Is this truely an "all-band" antenna? Most of my listening is in 118-137 Mhz, 154-159 Mhz & 460-470 Mhz ranges. The local police are going to a 800 Mhz system soon, so that range will become important.

P.S.

I have a discone mounted in my attic, but due to restrictions I'd like to use an outdoor that's not as easy to see.

slwork@netcom.com (Steve Work) scribbled:

>And also, do you expect the minimum-wage security types at
>the airport to even know what a scanner is, let alone a modified one.
>Don't worry.

Usually when I go to the airport to drop someone off, I take the scanner in...but I preset it to the local WX freq. on yesterday's occasion. I did this to make the security realize that a handheld scanner is not a magical weapon. Just a radio receiver with extra powers (actually they should think it's just a weather radio after turning it on).

So....when I used to go through security, the schmucks usually said "make it beep" (heh-heh can't do that with the Pro43 beep mod that makes it really quiet.). I just turned it on and static would be there.

Now with the WX programmed I thought I would have less of a problem. Wrong! As soon as I turned it on and raised the volume the announcer stated, "...forecast for the Dallas/Ft. Worth Area, cloudy and 30% chance for rain..."

You should have seen this guy bug-out. He said, "you can catch Dallas with that thing?" Remember folks, I live in South Texas along the US/Mexico Border (close to S. Padre Island).

After queer looks at me, and about two minutes of explaining that it was just a forecast coming from a local station, not from Dallas (what a dream...reception from hundreds of miles away....) he finally let me go through. He was still dumbfounded, yet he allowed his ignorance make the decision to let me go inside. He was just confused at why they were announcing Dallas WX.

I think he may be related to that guy at Radio Shack (ever notice that no matter where you go, the dumbest salesman at RS looks like the same dumbass at the other RS across town?).

I think I will stick to making static noises on my scanner.

Why not break it in at your home, instead of having
many ignorant customers drolling over and on it?

2543. AOR PC Software?

Newsgroup: rec.radio.scanner
Date: 1996-10-28 00:00:00 UTC
From: jweaver@newbridge.com
Message-ID: <jweaver-2710962254080001@138.120.21.76>
Source record: 219071

I am in the market for a scanner and am concidering the Yupiteru 7100, however, being a bit of a PC buff, I am intreagued by the ability to control some scanners with PC software (i.e. the AOR).

I would therefore concider the AOR 8000, however, what does the software allow you to do??..

Is it really worth it??.. Are there any things you can do using the PC that you cannot do with the scanner itself??..

Any information would be appreciated

Regards

Jon

2544. 2.0 Ghz to 2.6 Ghz

Hi All,

Question: What's there to hear in the range between 2.0 Ghz and
2.6 Ghz? If one is to buy a new receiver does it make any difference
in the upper receive limits?

Open to any comments. Thanks to all in advance.

:-) Greg

What is the best order, acending or decending frequency ?

: Unfortunately, no. I have tried this using what I thought was a clever
: sequence of MOVE's and COPY's from the scanner keypad, and would work on any
: bank to sort it in ascending frequency order, however, I invariably always
: had one or two that were still out of order. It drove me nuts, so I stopped
: trying to figure out a good way to do it. It involved writing down the
: channels in a bank and their frequencies, then sorting them on paper and
: going back and forth on the scanner.

: Seems to me the only quick way to do it is to upload a bank in to a software
: program and re-sort, then download back into the radio.

It is pretty easy with their windows software.

: This is indeed a feature that AOR should have put into this scanner.
: Perhaps even a sort alphabetically by alphanumeric tag (although scan speed
: would suffer).

: Mike

That's a gem. Suggest you check out John Cleese's video, "How to Irritate People," for further guidance on this art form.

And lest I be accused of going off-topic... The airwaves are public property (Communications Act of 1934). I am a member of the public. Therefore, I am an owner of the airwaves. As an owner, I have the right to use my property as I see fit - including monitoring it. (Licensing requirements are another topic entirely.)

Seems like this debate has been going on forever...

>Does anybody have info on the new Icom R-8500 receiver?

My email response to you bounced.

You can obtain R8500 information directly from ICOM or read the
advertisements in the hobby press. Shortwave, a British magazine
available at Borders book stores (USA), published a multipage,
qualitative review in a recent issue.

November 1996 Monitoring Times magazine contains Bob Grove's
high level comparison of the R8500 versus an AOR AR5000.

I've tested both models, bought an Icom R8500, and like using it.
Bob Grove had a problem with the R8500 he used overloading from
an S9+40 db FM broadcaster, but mine works well and I've not
experienced overload or intermod problems to date. It's sensitive
and easy to use.

That said, the R8500 lacks a few features, e.g. a 30 kHz bandwidth,
and you can't defeat the rescan delay using the front panel controls.

My quantitative AR5000 and R8500 reviews should appear in the 12/96
and 1/97 issues of Monitoring Times.

Gary,
I bought this same scanner for $300 about a month ago. I saved about $200(if bought at RS) over the 2042, I
used the diference to get an OS535 board that would allow my computer to do all the work of maintaining my frequencies.
Although, I can not download the freqs to the radio I can scan much better and smarter. If you do not have a computer the
2042 is a better product considering the additional frequency storing features. There is also the CE232 add on, a rival of the
OS535, this board is external and you can program your memories from this device. I chose the 535 for its compatibility with
software and other radios(CI-V interface).

Rob Kling

I just bought a new Pro2035 from Radio Shack, I got a really good deal

Hi,

I'm a newbie doing some homework before I go and buy my scanner. I notice some models, like the AOR8000 and AOR2700, can connect to a PC via the serial port (RS232).

Why might I want to do this?

Can other models like the MVT 7200 and UBC3000XLT do this also?

Any suggestions on a scanner are welcome. I'm looking for something that goes up to about 1G with no gaps, portable with AC and CAR adapters.

Thanks, Zoran.

>
>Thanks, Barry, WA2KLS
>
Um Barry.... You're supposed to ask what a scanner is like BEFORE you
buy it.....
Well the AR8000 is absolute rubbish, is more use as a pan scrubber
than a scanner, and however much you paid for it was too much !!!
Hee Hee only joking !
I have a circuit for an rs232 interface, cost of parts about 5 uk
pounds, software download radio manager its brilliant, and well worth
registering, dont know about a soft case, but.... if you use a bit of
sticky plastic, the type used for covering paperback books etc
and cover the display, its stops it getting scratched and can be
replaced as often as you like
PS although the 8000 is good the aerial supplied REALLY is crap

Sid

Jon,
The MVT and AOR are really two different beasts. One concentrates
on features(AOR) and the other on receiver performance(MVT).
The AOR has a LOT more features and controllability. This comes at
a price though...a user's manual comparable to some catalogs! ;-) The
bank/channel configuration is nice, twenty search ranges with lots
of lockout frequencies(500?), alpha-tagging and twin VFOs. The draw-
backs of the AOR seem to be it's construction...cheap case, top-
mounted buttons that are starting to come off and keypad lettering
that starts to disappear!
The MVT is a GREAT receiver with great audio quality and strength.
It has a lot fewer features than the AOR though making it easier to
program tho. It has 1000 channels but only ten banks compared to the
20 banks in the AOR and ten search limits. Biggest drawbacks for the
MVT are a non-programmable two-second delay while scanning and the
ability to scan a maximum of four banks. The construction of the MVT
is rock solid and receiver performance is the best I have come across
in a hand-held. Except for my R-1, my MVT gets used a lot to listen
on commercial aeronautical frequencies since it is tops for AM signal
quality and sensitivity.
Personally, my MVT gets a lot more use than my AOR. Of course
that's probably not an unbiased statement since I can just pick up
the AOR at any time. I didn't choose to own one over the other!
Interesting tho...when I bought mine the price difference was
about $60 US which is about $90 UK right? Maybe you're getting a
better deal on the AOR?
Good luck!

Strong signals,
Rich Wells

You just gotta keep it going, don't you?

Okay....here's bone for you to gnaw: if, using 100% of your intellect,
you could do ten percent of what I can do using 1% of mine, you'd be
perceived as having an "ego", too.

Look deeper, lad. It's not an "ego". It's a reality check that smacks you
betwixt the eyeballs and gives you an irregular heartbeat and nasal polyps.

Tell ya what, son, you get off the video games and the TV set; put the
play-toys and frivolous pursuits aside; and spend the next 30 years
learning everything you possibly can learn; doing everything you can
possibly do; going everywhere within reach and then some; shoot for the
stars.....say Aldeberan and Deneb....miss by a country mile...and hit the
moon instead.

You'll feel your cheerios, too. And you won't give a wad of belly-button
gunk whether anyone likes it or not. Because it won't matter one teeny
weeny iota. It never does matter when you got 'em and the other feller's
got 'em to get. His sniveling is only a matter over which to giggle a bit
and then move on.....

That's a tough old bone to chew, ain't it? :-)

>(so they can't hear other people's conversations). The airwaves are a
>public place.Don't kid yourself about privacy.

Exactly. That's why here in Canada, we have no laws restricting monitoring. Why? Canada Gazette in Feb. 1989 said it perfectly. "The radio frequency spectrum is a scarce and vital public resource". That's why the Radiocommunication Act states this for sections 4 and 9 (these are the sections pertaining to scanners).

4.(1) No person shall, except under and in accordance with a radio authorization, install, operate, or possess radio apparatus, other than:
(b) radio apparatus that is capable only of the reception of broadcasting and that is not a broadcasting receiving undertaking

9.(1)(b) without lawful excuse, interfere with or obstruct any radiocommunication.
9.(2) except as prescribed, no person shall intercept and make use, or intercept and divulge, any radiocommunication, other than broadcasting, except as permitted by the originator thereof.

In other words:

Scanners and scanning are legal anywhere in Canada. There are no restricted frequencies. A license is not required. You can't use what you hear for personal gain or tell anyone what you have heard.

So much for the U.S. being the "land of the free", eh?

I think i have an insight into the Cheek Guy...it's because he don't take their shit that is the answer to this whole flame thing. He states his standing and they cannot accept that it works. He has put their non-knowing standing at risk and to engage him is a risk and a horror which they must discredit as to be able to "take over the group" without the Cheek Guy.

Seems they may have succeeded, but now they have nothing to contribute....reality is at work.

bill conduit
I never met the Cheek Guy, but then I did.

I don't think I kissed his anus in what I said. I just
take an objective approach to his past postings and the
fun he has in answering some of the more dubious dolts
who inhibit the group and come to these conclusions.

you are a creative guy....you seem to know the definition
of most words used and are offeneded by the IDIOT of
MACKEY....but gosh, you fail to learn from the postings
what is going on ahead of you.

The Cheek Guy don't take anyone's shit....he stands up
and take umbrage at any who would disparage his name or
his "place" in the world he's grown up on....and in.

You seem to have an EGO fantasy too seeing as how some
of your postings have been egregariously pronounced.
So who is calling the IDIOT MACKEY black. The Pot and
the Kettle analogy.

If you cannot see the derision for what it is attached to the Cheek Guy for all that it is based on, then the "whoooosh" passed you by.

It's a generational thing....learn about it. For a man his age he's not all that wrong in his statements...sure he uses words like POOP and words which were used back in the 50's....but that is his history.

A lot of you should really think about taking an EST class from a authorized ESTian graduate....it's not the same as when in vogue, but it would be a start.

I kiss no one's anus...you should know that by now.

Anti-anus kisser,
bill conduit

Funny you should mention this. Recently, I bought a 2006 and was musing whether to do this so-called "speed mod." The fact is, I did on another model that I owned and did not see a bit of difference. Cutting the diode didn't seem to hurt anything; but it didn't help either. When faced with the same option this time, I elected not to do it. Has anyone confirmed whether this "mod" actually works?

For the most part, CB may be better, but FRS was intended to do things CBs fall short on. Note the F stands for "Family." The FRS is intended for such things as short range comms during family outings - events, etc. It is basically an event oriented utility radio. Therefore, low power is not a problem... If you want to talk to someone across town, surely it won't be useful, but if you have a group of people trying to coordinate a family event, and you want to talk through buildings (and don't want to share your communications with everyone who has a CB in the car) than FRS may come in handy....

>I live near Boston Logan International Airport and can listen to all the
>airport traffic from the planes but am unable to hear the Tower. I have
>the freq's but no luck. Does anyone have a suggestion???
>
>Hal Kingsley

Simple. I'm assuming you don't have the wrong frequency, like one for "Boston Center" instead of "Boston/Logan Tower", but I notice there are lots of follow-ups to help you verify your frequency. VHF communications are limited to line-of-sight. If the airport is beyond your horizon, you're not going to receive the tower's communications but you *WILL* receive the plane's transmissions because they originate at high(er) altitudes, within a direct line from your scanner.

In theory, you could picture a smooth marble with a radius of 3957 miles. Picture yourself standing on top of it and think how far you can see; the point where your line of sight meets the marble surface (i.e. the farthes you can see) is a point exactly "r" from the center of the earth. Your eyes are at some height "h" above the earth's surface so they're at r+h. The distance "d" between where you're standing and your horizon can be derived using the Pythagorean theorem: (r+h)^2 = r^2 + d^2; solving for d yields

d = sqrt((r+h)^2 - r^2) or

d = sqrt(2rh + h^2)

Thats the distance you can receive a station that's at ground level.

In practice it's hard to give an exact radius from the airport where you should expect to receive the tower because it depends on the height of the tower's transmitting antenna as well as your scanner antenna (not to mention the buildings in between that interfere with the signal). The higher each antenna, the larger the potential reception range. If your scanner is portable you could try brining it closer to the airport or to some higher ground to see the difference.

Hope that helps,
-Patrick Penzias Dirks.

Our man Cheek has a nice solution to this problem.
My suggestion is to buy his handbook(s).
They are hugely insightful regarding the hobby.
If you'd ask him, he'd probably tell you which
book contains this solution ... and then go ahead
and explain the mod to you in detail anyway. And
then tell you to email him if you run into a problem.
And then step you through the part where you didn't
pay attention ... all the time being cordial and
friendly. At least that's my experience.
Flame away IDIOTS.

2581. Bill Cheek and flames

Newsgroup: rec.radio.scanner

From: Eric Oyen <n7zzt@goodnet.com>
Message-ID: <32752E73.5831@goodnet.com>
Source record: 219109

Well Folks,
It *WAS* quiet around here for a bit, and now the flamers are back...

Why can't you guys jusr accept the fact the Bill has done things that you can't even approach? Why must you besmirch his good name over some trivial point? In fact, WHY DON'T YOU USE YOUR HEADS FOR THING BESIDES A COLLECTIVE LOT OF HATRACK??????

Get with it, guys.

Consider the foolowing pionts:

1. Bill Cheek is a published author with some technical background in electronics engineering,
2. Mr. Cheek has demostrated a "working knowledge" of electronic gear (in general, and scanners (in particular),
3. He has also demonstrated a resolve almost as strong as a steal/titanium alloy mix,
4, he doesn't need to prove what he has already demonstrated that he KNOWS.

Now, admittedly, he has "seemed" a little off base when dealing with the ignorant masses, but do you blame him? I think not. How else can a person respond to repeated stupidity over a long period of time?

So, without further adue, lets all get back to the business at hand, scanners....

Yes, but CQ Comms is a prime example of a publisher getting too greedy.
They had no business coming out with a CB magazine. Most of their
adverstisers' merchandise could be purchased locally so national
advertising was a complete waste of money. This pub was doomed from the
start. And CQ VHF...give me a break. This magazine is a complete joke.

Please forgive a Limey for pointing this out to a Yank, but a 30-06
(thirty ought six) is not a shot gun, double barreled or not! 'Tiz a
30 calibre rifle (or carbine) m'dear.

However, with that minor, but necessary correction in the interests of
being a pedantic old sod, I do tend to agree with the spirit of the
meaning .

Any which way, this has nowt to do with scanning but being nosey, I
just had to interfere.

>I would encourage anyone with the money to get an AR8000, no questions asked

You do have good taste though.... :>)

Humour (?) mode off. I too recommend the AR8000 even for a newcommer
to the hobby. My recommendations are based on the following
assumptions:-

1) If, after a few weeks of trying out the hobby, you get well and
truely hooked, you have one of the most versatile hand portable radios
around - you will not regret buying it. If you do get hooked (highly
probable) you could regret buying an inferior radio

On the other hand...

2) if you give up the hobby 'cos it doesn't turn you on, you still
have a desirable piece of kit that will sell readily.

OK, so there are other radios about that are easier to get going
straight away. But they won't do what the AR8000 will!

Stuff it on "Novice Mode" take a couple of days out to get to grips
with the hand book and the world is your platform. Every minute with
the handbook will reward you with hours of listening pleasure.

>because you will eventually get a lot out of it. However, I can recommend

I've had a BC100XLT, BC200XLT, and BC205XLT, and know the part
in question. Two screws fasten the spring to the bottom of
the BC100XLT.

The service manual for the BC200XLT doesn't show
a picture of the spring. My best guess is that the spring
corresponds to the following part from the the 200XLT parts list:

Part no. Description

HPSP421080Z Plate; spring C5210R 0.3T NI

It sounds like your transformer is on the blink....not producing enough amperage. Try a 12V wall wart and see if it still happens. If you don't have a wall wart, then use a cigarette adapter (and your car, too!) and see if it still continues.

If it doesn't then you hit that problem, if it does then it is between the board and the power supply area.

Just a suggestion...seeing as no one else wants to give out free advice.

First, it's not a good idea to change the CPU clock crystal/resonator
in a scanner as a way to alter scan rate.

I added diode D501 to the PRO-2006 I reviewed in October 1990
Monitoring Times, but measured no difference in scan or search
rate thereafter. This is confusing as I've seen postings which
claim otherwise. ....Your mileage may vary.

In article <malex-ya023080002810961507290001@news.kersur.net>,
Michael Alexander <malex@kersur.net> wrote:

> ... I bought a 2006 and was musing whether to do this
>so-called "speed mod." The fact is, I did on another
>model that I owned and did not see a bit of difference.
> Cutting the diode didn't seem to hurt anything;
>but it didn't help either. When faced with
>the same option this time, I elected not to do it.
>Has anyone confirmed
>whether this "mod" actually works?

From the PRO-2006 review:

" ...The PRO-2006 has two scan speeds, which measured approxi-
mately 13 and 26 channels/second. While scanning at high
speed, the PRO-2006 won't skip over weak signals like some
of the AOR-2515 scanners do. Adding diode D501, situated at
an unmarked location between D502 and D503 sped up the PRO-
2005 scan and search rates by 25%. Adding the same diode in
the PRO-2006 has no effect on the scan or search rates.

It has been claimed that a PRO-2005 could be made into a
PRO-2006 by merely replacing the CPU clock crystal with one
of a higher frequency. Don't believe it. Changing the
PRO-2005 clock speed would affect both the rescan delay and
the priority rate, and they would no longer be 2 seconds
long, as they are in the PRO-2006...."

If the freeze stops at the same channel every time. You need to delete
the channel it stopped on from the 8K keypad. I think this happens
from data not being completely deleted when editting channels from
the keypad. I now delete the channel from the keypad then add the new
channel.
Hope this is the problem . If not e-mail me with details of your set-up.

I got a MVT7100. I think its nearly a perfect radio,extremely sensitive
and easy to use. It don't work too good in large cities though. It
jams up with noise in Honolulu. Any where else it picks up everything
anyone would want to hear. Ace Communications says the MVT7100 is the
best handheld scanner available bar none. I think that may be true...

Hello all,

Awhile back, I posted the following for a friend, at the time he sold all the radios he was willing to give up. Now he wants to sell the rest, AND has DROPPED the price $150!!

A friend of mine has a "bunch" of Yaesu Dual Band Radios which he would like to sell at a great price. He purchased them for the emergency response group which he is envolved in and has decided to sell them and get radios which do not have as many functions and features. His policy appears to be "the simpler the better" for emergencies.

Yaesu FT-530 Dual Band HT
Yaseu Standard 2 Watt Battery
Yaesu Hi-Power 5 Watt Battery
Yaesu Rapid Charger (for both of the above batteries)
Yaesu Standard Battery Charger
Yaesu External Speaker/Mic
Yaesu Standard "Rubber Duck" Antenna
Antenna Specialist's Dual Band "Rubber Duck" Antenna

Each of them have had the out-of-band modification done by a local Southern California Dealer at time of purchase. They will be sold on a first come first serve basis.

He is asking $320.00 for each radio. They may be placed on a credit card for no additional fee, and there is a $5 shipping charge to anywhere in the US via UPS insured ground.

If you are interested, please call Steve at 818-502-0000.

(I am posting this for a friend who does not have access to the newsgroups, please do not write me back.)

As far as recieving from the helecopters, first thing you have to find out what frequency band they are operating in. Usually they are near the MDS (1900-2200 MHz), or they may be in the 7GHz band. They may either have syncronous antennas which track the recieving site or they may run omni and the recieving site tracks the transmitted signal. Their power is usually under 15 watts, and being microwave it IS line of sight. The video modulation is FM as are the audio carriers, usually 6.2 and 6.8 MHz, some have special subcarriers for other data. Basiclly they use the same equipment as the ENG trucks on the street and have to share the same 2 bands with them.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom

IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is

known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable |
Loss of Audio and Dial Lamp |

If you can program frequencies into your BC200XLT but there | is no audio and the green backlight no longer functions, a | tiny transistor may have failed. |

Check for a defective PNP surface mount transistor, Q201 | (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC | to several stages of the BC200XLT. Its main purpose is to | switch off power hungry stages of the BC200XLT when the CPU | thinks the NiCd voltage has fallen below a threshhold. | That's an attempt to limit the current drain on weak NiCds | to avoid permanent damage. |

Q201 is located on the foil side of the "Micom" board, | adjacent to the black multi-pin connector which mates the | Micom and main boards together. |

Q201 can be destroyed by a few different causes, primarily, | by something in the scanner drawing too much current | through it. In one case, capacitor C36 shorted. It's a 220 | uF 10v electrolytic, located on the component side of the | main board, connected from pin 8 of the audio IC (IC2 |

NJM386SL) to ground. In a pinch you bypass Q201 by |
soldering a short piece of bare wire between the collector |
and emitter. |

Other Problems

Complaints of low audio output and occasional microphonics
in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder
connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier
activated relay inside the BC890XLT wore out. Andy found
the identical relay sold at Radio Shack (part #275-232) and
says the BC9000XLT uses the same relay, too. |

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies. The 1996 edition contains selected business frequencies, too, but callsigns are listed only for local government and public safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed

full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350

Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined

the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a

local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's

transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Hi!

I have a Sportcat 150 that I bought last year. I also recently bought two Uniden GMR100s used without a manual. I called up Uniden and they sent me a Owners Manual for $7.50 plus tax. They Sportcat manual is pretty thick, so I think it would be worth it!

Uniden Phone Number:

1-800-297-1023

>is this normal for this radio.

This has to do with what search mode you are in.
There are 3 search modes. One of them only stays on active freqs for I think 3-5 sec then resumes scanning.

You say that an induvidual doesn't have a right to use public property for his own use. When a person uses the public airwaves to transmit a signal, and then says that no one can listen, he's using the airwaves for his own use. By the way, the FCC is supposed to regulate spectrum usage. When your just monitoring, your not "using" any spectrum, and your not communicating. I see monitors as being outside the jurisdiction of the FCC. Whether or not you monitor, it has no effect on the electromagnetic spectrum, so it falls outside their sphere of concern. They don't have any ligitimate authority to pass laws on monitoring.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, airplanes, armored cars, trains, taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air

Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and

the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which

gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US

Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over | 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.excalibur.net/~plaws/scan/scan-l.txt |

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago

chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

First, not many fool with it for those few days, but it does sit there and cook. I'd rather take one home that I know will not fail, than to have to pack it back up and drag it into the store again. Saves a trip for me. It's called "economy of motion."

About new cars...I ordered one (a truck) from the chevy dealer. Had it built just the way I wanted it. Got it at the dealer and there was almost 150 miles on it. No way was the transport truck 150 miles from the factory, so I assume someone drove it somewhere. I guess you could call it a used vehicle then, if you were real picky. I figure that those 150 miles mean that the thing is road worthy. Just another thing I won't need to take back to the store. The process hasn't failed me yet, so I don't plan on fooling with success.

For the same reason we find baby monitors in the master bedroom; no
spare room in the house or apartment for Junior to have his own room.
I'm not saying this situation will be common, but many know that it is
a distinct possibility. Mom or Dad may have set the camera on a chest
of drawers overlooking both the crib and bed. They may forget to turn
it off when they retire hence providing a monitor more than a shot of
Junior sleeping.

I have attempted to create a list of freqencies for the New Orleans Air Show on
Nov. 2nd & 3rd. I used several different sources. Some of the Blue Angels
frequencies are questionable (???). Other may no longer be used. The banks
and channels are just my personal preferences. I don't know if the Golden Knights
will be at the show but they have been there in the past so I included them along
with a list of other possible airshow frequencies. If anyone knows of anything I might
have missed, got wrong or has any other airshow info, please let me know (E-Mail
preferred). Let's hope for clear skies!

1 122.0750 to 124.000 - Civilian Teams

> Thanks
> conel@thecore.com
I owned an SBE Opti-Scan when they first came out (about 1977 or
1978).

The unit originally came with a book listing the codes for every
possible frequency. I also developed a program for an early HP
programable calculator to print out the code for any given frequency.
Unfortunately, I cannot lay my hands on them at the moment.

However, I can tell you that the algorithm for the program was able to
be deduced from the codes on the cards. That's how I did it.

The bottom line is that this receiver was never a very good performer.
It lacked preselection and was quite prone to images and intermod.
The VHF high band section in my unit also became microphonic after a
period of operation. In metropolitan areas such as Los Angeles, the
UHF section was unusable because of interference and de-sensitizing
from other strong signals.

I returned my unit to the factory while it was under warranty for some
modifications. This helped only slightly.

I replaced the unit after about a year.

The unit covered the following bands:

30-50 Mhz
150-170 Mhz
450-470 Mhz

It also covered either 470-490 or 500-512 depending on how it was
configured at the factory. If you have the algorithm for the card
codes - it can receive outside these ranges a bit.

Hope this helps a little.

>Therefore, I am an owner of the airwaves. As an owner, I have the right
>to use my property as I see fit - including monitoring it.

No you don't. You are one individual, not the public. Public property is entrusted to an administrator or administrative body for use as intended by the public as expressed through appropriate laws, charters, rules, policies and/or guidelines. Many public officials, employees and others have found this out the hard way by going to jail for diverting public property to personal use. This is usually for tangible property mis-use, but intangible property abuse is protected by law just as much as tangible.

Your statement "As an owner, I have the right to use my property as I see fit" when referring to public property should be re-worded to say "As a MEMBER OF THE PUBLIC, I have the right to use PUBLIC PROPERTY as THE APPROPRIATE ADMINISTRATIVE BODY sees fit".

>(Licensing requirements are another topic entirely.)

No they're not. They are an integral part of the codified expression of the public's intent as to just how the particular public property shall be used. For example, drivers licenses, speed limits, load limits and rules of the road are all part of the laws governing highway use. Granted, you might not agree with the code, but that's the way representative government works.

If the law says you cannot overtly monitor certain frequencies, that is just as binding legally as the prohibition of amateur radio transmissions outside the amateur bands.

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units

unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot

on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models | are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - Icom R8500 |
Jan 1997 - AOR AR5000 |

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical

relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by

reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Rugged construction. External power supply. DB25 RS232C connector. Ok scanning and great searching performance.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and

keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor.

Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby

SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber

keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image

rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. | See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in | Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High

synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police

district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner | using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models

differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan-nels	VHF low	VHF high	UHF scans?	lock-outs?
FR104	6	X			no
FR105	6		X		no
FR2512	24	X			no
FR2513	24		X		no
FR2514	8	X		yes	no
FR2515	8		X	yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts

difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping
and handling. For an additional $4.00, I will include a
custom frequency allocation histogram, a 0 - 1,000 MHz
"spectrum analyzer-like" display showing spectrum usage by
the transmitters in the map coverage area. Send check or
money order payable to Bob Parnass for $25.95 for standard
or $29.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along with
center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas
Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central
time. For a brochure, send SASE.

From the FAQ:

See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in
Monitoring Times, March 1995. For tips and modification
information, see my column in June 1996 Monitoring Times.

Reprints of articles from Monitoring Times are available
for $2.00 each plus a self-addressed stamped envelope from:

Grove Enterprises, 300 S. Highway 64 West, Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

Note: I don't get any part of the $2.00.

I'll agree with you on the CB magazine. It seemed a little vague. BUT, I like CQ VHF. It seems to be the only source of that kind of info. I'd like to see it go a little more in depth, but that is the only problem I have with it.

I have owned both.
In fact when I was in the UK was when I bought my Yupi 2 yrs ago and
the price difference then was 40-60 UK pounds...

The YUPI is a graet radio... easy to learn.. easy to use...
sensitivity is great. As I remember there were fewer yet larger banks
so that there was the same # of memory channels.

The AOR is not quite as sturdily built, but it is very adequate for
most peoples uses.. It is a bit lighter physically.
it has ALOT of complexities but the basics are easy to learn.
The sensitivity is comparable to the YUPI.

If you want to be able to reprogram the search banks or memories the
AOR is best since it allows programming from a computer (using the
optional computer interface). I use this when I travel back and forth
between different areas. You set up the radio for where your going and
its got the police for that area in the bank you use for them at home.
When you get back, reprogram it back in a few minutes.
The AOR allows you to put an alpha numeric name in the window with the
frequency, so you can remember what the user of the frequency is.

The password option on the AOR is nice but I haven't yet had any
reason to hide the frequencies that I scan from anyones eyes.

The AOR has a slightly wider frequency band but they both cover the
areas where most of the 'good stuff' is.

Like the yupi, The AOR can be set up to search between two
frequencies, the difference is that the AOR can automaticaly store the
frequencies it finds. The AOR also can be set to automatically choose
the proper modulation used in that portion of the spectrum, according

to the bandplan programmed into it.

the Yupis controlls are all on the front or top, The AOR has 4 of them on the side as well.

I guess I would say you can't really go wrong with either from the standpoint of user interface, frequency range or sensitivity. The issue is will you need or want the other features later? will you use them?

By the way I sold my Yupi to buy my AOR. I don't think I made the wrong choice.

My yupi was bought from Nevada in Portsmouth, Hampshire, UK
They matched someone elses price to get the sale and still threw in a few 'freebees' (a case, a book of frequencies.....) they may not do the same for you but it doesn't cost to ask.....

From: Bill Beekman <string@ix.netcom.com>
Message-ID: <32763256.1D40@ix.netcom.com>
Source record: 218999

I was wondering if anyone has had problems using the computer link cable for the AOR 8000? I hooked it up and set everything up. The process of dumping the data to the pc got about 1/2 way done then froze. Now the connection will not work.. Any suggestions? Are the driver chips on the connector prone to going bad?

Excuse me for taking Cheek's side here (and you don't know how much it pains me to do this...) but he DID let it go, and you and others tried to start it up again.

As for Bill, of course, he did snap at the bait you dimwits offered, so he's not off the hook on that score.

The whole lot of you should newgroup alt.fan.bill-cheek, then you all could take the flame wars there. I might even join in myself, if things got interesting.

I've said this before, and I'll say it again. If you don't want flame wars, DON'T RESPOND TO FLAMES! It's that simple. Unfortunately, simple people can't handle this solution.

And yes, Cheek, this goes for you, too. If you STOP responding to the baiters, they'll go away eventually. Of course, you know that, so you respond, knowing that the wars will erupt anew, and you can continue to get your desired attention, and can pretend to be the victim rather than the perpetrator.

Fellahs....fellati..'s

Now that I got your attention:

The IDIOT OF MACKEY needs your response to be assimilated into
the Main-poop of society. He needs RESPONSES. He needs to be
who you make him out to be so he can be the shit he is. He is
valid because you (and Me here, I guess) make him so....kindly
think about what you are doing. You are giving dying dried-up
shit water to survive by and remain smelling shit.

Members of a better way....unite and no longer excite the IDIOT
of MACKEY to show us his peculiar prepubescent character.

Your posts keep him alive. Quit and he will not survive.
Your angst at him he lives for. No more.

I know he's the things we throw peanuts at because he was hit
hard by an ugly stick....but enough is over already with this
odiferous non-being.

Quit posting about him and you deny him existence...he needs you
badly in order to be the IDIOT OF MACKEY. NO MORE is the sign on
the door.

Allow him to be blown away when the wind clears the air for
humanity and anyone else who understands.

bill conduit
etc. guy....

loved that post by the other cheeks guy....what a combo.

2645. Re: Uniden 8500XLT mod.

Newsgroup: rec.radio.scanner
Date: 1996-10-29 00:00:00 UTC
From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <55594p$27l@coranto.ucs.mun.ca>
Source record: 219005

Here is the message I found but can trace down the owner. I think
it's about 2 to 3 years old.

Attention All BC8500XLT Owners (or future owners)!

Don't count this one out yet!

I have successfully got this thing so it is a coninuous receiver from 25
to
1300 MHz. It allows direct keyboard entry of any frequency. If you are
doing
an AUTO search, the freqs are properly stored in memory locations! (I
get
excited about this because my first attempt wouldn't allow direct
keyboard
entry or to save freqs in memories! But never fear, ALL works great now!!!)
I have already modified two with no problems at all!

So everyone hang tight, I am trying to get a hold of the scanner guy at
Popular Commuications (and others) to see if they want to publish.

-Jon

2648. Re: Why doesn't my discone work very well?

Newsgroup: rec.radio.scanner
Date: 1996-10-29 00:00:00 UTC
From: doc@dxnet.com
Message-ID: <32768da1.11680954@news.dxnet.com>
Source record: 219008

SNIPPED to fit...

>I recently installed a discone antenna about 20 ft. high, but it provides
>no better reception on 45-165 MHz for my PRO-2006 that it gets using just
>the little whip antenna mounted on the case. I checked that the cone is
>grounded OK and that the disc is not shorted to ground. The discone is
>connected via 75' of RG58 cable; would RG8 improve performance much?

*75 feet of RG58 will cost you about:

43% of your signal at 50MHz
64% of your signal at 160MHz
82% of your signal at 460MHz
92% of your signal at 860MHz

*Above notes taken +/- from POLICE CALL, 1996.

The above figures are for quality, name-brand coax. Low cost brands
tend to cheat on: wire quality/quantity, shielding %, foam/dielectric
material choice, and jacket... so your losses may be even higher!
RG58 is ok for SHORT runs with LOW power applications, as in jumpers
or very short antenna runs, but avoid (if at all possible) runs over
twenty feet.

I once got a super deal on close-out, "X-Brand" coax... ok, it was
Radio Shack RG-8, but as I removed the outer jacket to install the
first connector, I could SEE spaces between the sheild conductors,
as if a number of wires were missing from the braid! I could easily
SEE between the braided sheild, through the dielectric and to the
center copper strands below that! I sure didn't want to press it into
service, so I took the junk back. What a lesson.

As others have mentioned, in it's classic configuration, the DISCONE
antenna offers no gain. As a 'flat' load for a transmitter, it
should work just fine at it's rated frequencies. But always remember
that when one adds a zero-gain antenna to poor/aged/inefficient/cheep
coax, the losses take their toll in a hurry!

I use a Diamond Tri-Band vertical for 144/220/440MHz. It offers
mucho gain, without the 'noise' a pre-amplifer would introduce to my
scanner. Besides, as a general rule, a pre-amp is installed at the
receiver, AFTER the loss the coax and connectors gave you! Don't
forget that pre-amp noise can be so high, desired weak signals can be
burried under it! The simple fact is, one can't hear or amplify
signals they don't have.

While the Diamond offers the most gain at the center of the above bands, there is still enough gain on the 'skirts' to make the antenna well worthwhile. In addition, there seems to be enough mass and conductor in the sky, that the antenna works well at 30MHz too. FYI, I use about 30' of 9913 Belden coax with quality teflon connectors and a good ground system.

MJane!

I've never considered it, but now that you've mentioned it, WOW!...
This evening after my long commute to and from work, I'm taking a
chisel and hammer to my SIX BOSE SPEAKERS, located ALL AROUND ME,
in front of me, next to me in the door panels and rest assured, I
won't forget that pair BEHIND me either! They all must go!

Monday I am mounting a expedition, I want you to be in charge, to
both the North Pole and South to dig-up those damned BIG MAGNETS the
DEMOCRATS burried lo those many years ago, used to keep all races
POLARIZED!

Our plan is to MOVE those magnets to the Moon. Now, here on Earth,
one simply tosses a empty can into the air and Zap!, the can is on
it's way to a crater and half of our ecology problem is solved!

MJane, please don't forget the MAGNETS on your REFRIGERATOR DOOR
because they were placed there to 'get' your FOOD! 'Oh Damned!...
The MICROWAVE's gotta' go too! No Microwaves without a HUGE MAGNET!

Be advised, our next Newsletter reveals that DENTISTS are part of
'the plan' too! Dentists have placed tons of SILVER fillings in our
heads, because it's a well known fact that Silver is one of the BEST
CONDUCTORS in the World(!)... thus assuring each of us would RECEIVE
"MAXIMUM MAGNETIC PULL" ("MMP") right UP to our BRAINS, 24-hours a
day! ARGGGG!

Warn everyone now! Don't go to any more LARGE STORES either! They
exposing our BODIES to known QUANTITIES of PHOTONS, measured at
MICROWAVES(!), all part of 'the evil ploy' and cleverly disguised
as: AUTOMATIC DOOR OPENERS! But the trick is, if you must go, Let
someone YOU DON'T LIKE go in first! You RUSH in - BEFORE the door
closes.

MJane, these are all FACTS, each proven by utilizing the well known
method where we place our arms out even with the horizon and spin
round-and-round-and-round, until we actually CANCEL the evil

Magnetic Influence by spinning FASTER than the Gravitational Pull!
Very similar to the PULL I am placing on your leg now. Notice when
one STOPS how everything now MOVES on it's own? This is how life
REALLY IS, but soon, the magnets will all have their way.

Your Uncle T.
WA6IGJ

Tell him dude.....

Hey people get out your manual to your cell phones and look in the back.
It says something to the fact of:

Its against the law to curse on the airways!
Boy from what I have heard, 2 out of 5 cell phone users are breaking the
law!
You never hear of anybody getting fines or put in jail for that do you?
So why the hell do you think someones going to get sent off for
listening to it?
Its a stupid law just like the privacy act.....only a few pay any
attention to it.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)

: Could be an effect of a simulcast signal with one of the xmitters being
: unstalble and drifting during the transmission. This could explain why
: it is cyclic based on the period of the drift...

: Just a thought...MikeN

Could be another transmitter on a very very similar frequency, but not
quite the same frequency.

When two frequencies are similar but not exactly the same, they drift
in and out of phase with each other. When they are in phase they

re inforce each other creating a slightly stronger signal. When they are out of phase they work against each other creating a weaker signal. If they are of similar strength then they will virtually anialate each other.

The speed at which the signal strength changes is exactly equal to the difference in frequencies between the two signals. So if as you say your signal is dropping out 3 times a second, then the difference in frequency between the two signals is 3 Hz.

Richard.

I found an old tunable VHF receiver at a swap-meet. The brand is "SONAR" model FR102D. It can be tuned from 150 to 175MHz (Megacycles used on the dial face!!). It also has a switch for a fixed freq. and one crystal sockit inside. I took it home and plugged it in and set it to 162.40, the local NOAA station, but heard nothing. About 2 minutes later it came to life. By God, there are tubes inside! I opened it up and found it had 7 tubes and the tubes were marked "Built for SONAR by RCA". (The original tubes still work). Anyone know when this beast was made or who used them? Thanks, Steve Ralston Escondido, CA

If you play with the volume controls alot, you might be able to get some pages to decode. If you add a couple of diodes and resistors, you might get a few more pages to decode. If you build a schmidt trigger or use the discriminator output you might get all the pages to decode.

It would also help to know the speed of the paging company's transmissions. Lacking the know how to locate the discriminator output of my SC150 and being too lazy to procure the parts for the schmidt trigger, I have also experimented with the audio output of my scanner with limited success.

All I can say is that through the earphone jack, you probably will not be able to decode any pages above 512 baud (they can transmit at 512, 1200, and 2400) I have been able to decode maybe 25%-50% of the pages at 512, but none at the higher speeds. Then again, not having instructions in English, I don't even know if the program will decode 1200 and 2400 baud transmissions.

I have an AOR AR8000 that receives from 100 Khz to 1950 Mhz. I verified this by receiving an air nav beacon on 365 Khz and a lowfer station at 184.5 Khz. From a discussion with other 8000 owners on the newsgroups, most 8000s come from the factory with 500 Khz to 1950 Mhz coverage. I wonder if I am the only one that has a 8000 with Long Wave receiption? Just for note, I bought my 8000 two months ago, and did the eeprom modification for 800 receiption using Radio Manager for windows. Anyone else got a 8000 that receives below 500 Khz?

Thanks and 73

Why the "magic" offset 21.6 MHz? Is this value the same for all scanners?

Yes they can..... on the 7 frequencies allocated to GMRS that also are
the same 7 frequencies that FRS and GMRs share.

Rob:

How come you're wasting YOUR time and YOUR money reading USENET posts when there's so much work to be done saving the world? All that money you waste on computer gear, online charges, and electricity - not to mention all the time you waste looking for people to criticize when you could be out "dealing with things that are going to help our world to progress."

In case the satire is over your head---

If Dr. Pepper wants to go run around in the wilderness with a bunch of radio gear on his own time and at his own expense that's fine. I hope he has an absolute blast. It's not your place to judge him or anyone else.

Get a life.

<snip><snip>

A little hint from Downunder,
Provided that you don't need a lot of flexibility, or can add a length of
flexible cable in the reception laboratory :-) why don't you try thin
ethernet cable (co-axial). It's 50 ohms, similar size to RG59 and usually
6dB better at 1000 MHz. Even better - it's usually 1/3 the cost of RG59.

If you prefer RG8, try thick ethernet cable (also co-axial).

Watch out - you need to use crimp type connectors and may need to make up
some collets to build up the diameter at the shield.

Also, make any bends fairly gentle, since if you crush or crimp the cable,
it's history!

Australian amateurs have been doing this for a few years now and it works
very well.

Good luck, and let us know how you go!

Actually it will receive right down there, the sensitivity is pretty poor though!
Mine starts dropping off around 1800 KHz, still O.K. at 300 KHz, but you gotta really pump in the R.F. at 150 KHz!

Behold brothers and sisters, I bring you the profound story of how King Mackey the Great became so. It is an exciting tale filled with wonder, awe, and heroic deeds. Come closer, as I relate this grand history.

In the land of Scannerdom, there was a terrible injustice in the county of Power Supply. The evil mercenary force from Capacitor held the people of Smoke prisoner. Repeater, the ruler in exile of Power Supply, offered a rare and unused Radio Shack battery card to anyone who could free the people of Smoke from their Capacitor prison. A young and fearless warrior stepped forward to take up the gauntlet. Repeater told him of the dangers but the young man was undaunted and resolutely set off to free them.

When he arrived at the gate, Mackey was challenged by the fearsome guardians Positive and Negative. So terrible were these mighty sentinels that even the renowned guardian Cerebus trembled when faced with Positive and Negative. Armed with his trusty screwdriver he didst battle with them. Now, the screwdriver is no ordinary weapon in the hands of a professional. But our hero, battle tested and proven in the labs and urinals of Technical School, was no simple professional. He had become a Grand Master of the Number Two Phillips Blade.

The guards fired spinning hex nuts and sliced with the dreaded razor sharp quartertwenty threads. Again and again, using every feint, lunge, and parry the guardians had learned in centuries of defending the cabinet, but to no avail. In the end, Mackey maneuvered himself and with one swift strike, he ended it. He had touched both guardians in the only way to kill them. He bridged the gap between them in a move only a Master Bladesman could execute, the Short.

The Capacitor force exploded from the cataclysm releasing the Smoke from their electrolytic bondage. Afterward, the Smoke rewarded Mackey with their highest honor, the Diddler of the Spark.

Mackey, hoisted by his own petard, began the journey home. In the land of Recdotradiodotscanner, he was attacked by the Legions of Ennui. These were no ordinary warriors, but elite shock troops. Armed with the latest in Apathy, Disdain, and Contempt, they lay seige to our hero.

For months, a battle of attrition was waged. One after another, mighty warriors all, they fell. Even I, your humble scribe was a soldier in the Legion of Ennui, but I too, fell to the great Mackey. No one could understand how a single man could withstand such an onslaught as we heaped upon him. That is, until we learned the source of his great strength. He was the most favored disciple of the malevolent gods Fraud and Liar. They had taught him the secret fighting languages of Turpitude, Innuendo, and the most deadly of them all, Obscenity. Repeatedly, he repeled the attacks with adroit displays of oratorical onanism.

There was a point in the war when we thought we were going to prevail. We had Mackey surrounded, he was in everybodys kill file, and his ISPs were terminating his accounts as fast as he could login. He had been beaten back to where he stood alone armed only with a 300 baud modem and a Commodore 64.

Alas, we were all victim to his great strategy and now he sprang his most devastating weapon. Surrounding him with our keyboards poised for the final death blow, he hoisted his hands above him. Like Moses bestowing the Ten Commandments to the chosen people, in his hands, his mail-order diploma proclaming him Master of Communication Technology smote us down.

Cowered by the supreme Divinity before us, a hush fell upon the surrounding army. The only sound was a muffled cough from one of the younger soldiers. We lay prostrate on the ground before him fearful of his wrath. Who were we to show the temerity to challenge his divine turgescence. We waited. Slowly, he walked through the defeated masses and went home.

Upon returning to Scannerdom, word of his great deeds had preceded him. He was ordained Supreme Grand Master Fool of the Universe and the people clamored for his ordination as King. In response, the Church of Scanner Mods proclaimed him King and the great sage and visionary Pope Bcheek presided over the coronation. As he placed the Discone Crown upon his head, he spoke the sacred papal blessing, "This boy reeks."

So there you have it, brothers and sisters, behold the saga of his fetidness, King Mackey the Great, Ruler of Torpor, Supreme Grand Master Fool of the Universe, Grand Master of the Number Two Phillips Blade, holder of the Diddler of the Spark, Divine Master of Communication Technology, High Priest of the sect of Fraud and Liar, and Orational Master of Turpitude, Innuendo, and Obscenity.

All hail King Mackey the Great.

Don't the flames ever go out? A few months ago I saw the same attacks on you (Bill Cheek). Does it end or is this an ongoing thing?

The people who read this newsgroup seem to have forgotten that scanning is the topic for discussion, not someone else's personality.

I think that a newsgroup for personal attacks, like rec.assholes.attack, should be created and any comments not related to the scanner hobby be directed there. In my opinion, for what it's worth, questions or comments relating to the hobby are the only things that belong here.

Maybe not you but the rest of us do! Your the loser.
Scanning is a great hobbie! I have many hobbies and scanning is my
favorite.

My wife loves scanners to

One morining we woke up and I turned the scanner on while getting ready.
It quickly stoped on a well known DEA frequency (418.625) here around
Knoxville. The more we listened the better it got. So we finally loaded
the scanners (all 7 of them) and the hand held freq counter, and off we
went. I know this is exactly what the authorities DON'T want but what
the hell, This was a one time thing. Since we knew where they were, we
drove by and parked at a gas station about three hundred yards away and
set up shop. I found thier stake out frequency and listened to the low
down. After listening to them for about 30 minutes they all got ready
for the take down! The suspects were in a local hotel. They were
suspected of hauling drugs. The DEA had both rooms on eithr side of the
suspects room. The suspect were four BIG ass Mexicans.
When they all got in position the signaled on the radio and all hell
broke loose!
I had no idea that there were that many DEA agents around here. They
poped out of cars, vans and hotel rooms, kicked in the door and brought
the suspects out. No body was hurt and no shots were fired. It was

great! Just like watching COP's on TV but 100 times better. In the End they had to let them go because they found NO drugs on them.....come to find out they were just up here collecting the money and wiring it back through Westen Union.

Note: It is not smart to put yourself in any harm or to jeopardize a undercover operation....if you choose to do so you run the chance of being arrested or even worse hurt or killed. If you cant resist stay far away and have a good time.

You might even get some good video and/or pictures like I did!

GO AHEAD WITH THE FLAMES!

2687. Semasoft POCSAG decoder question

I have tried to use the Semasoft POCSAG decoder, but the only message that I get is 'PREAMBLE' and I can't get anything to decode. What does this mean, and has anyone had any luck with this program? If anyone has gotten this to work, what frequencies are you listening to and what kind of scanner do you have? I am using a BC700A. Thanks for your help.

Most people scan video already. It's called channel surfing. I'm going to make an assumption and say that these video monitors for babys will transmit on normal TV channels so the consumer won't have to have any special receiver. If that is a good assumption, all you need is a TV and an antenna. Move it around till you find someone. It would help to do some research on the manufactures of the devices to find out what channels they typically transmit on. HOLD DOWN THAT CHANNEL CHANGE BUTTON. To stop scanning: Leave your finger off the channel change button. -much simpler than actual voice scanning- (if my assumption is true)

Finally some sensible information. Most all of this is in the 450-451 Mhz areas. A few rare one have been caught in the 170Mhz press freq ranges. The only exceptions are those that have moved up to encrypted UHF to prevent unauthorized use of their information.

Here in Maryland 450.4875 and 450.850 Mhz have plenty of activity in the Beltway area, and makes for some good listening too, more fun than some morning zoo stations.

I noticed a post about the lead wire to a discone, saying that it shouldn't be too long or cross itself. I have an outside antenna mounted above my TV antenna, (only about 6" above it). My extra coax I wrapped in a neat circle and tie wired it together. Should I eliminate the extra wire? Thanks.

I agree it's not the ideal way, but it worked for me on a PRO-34 and 2006. Sure it shortens the delay time, but the speed increase was worth it. I compared both chipped scanners to stock units and detected no loss of signals.

I don't recall the crystal I used in the PRO-34. The 2006 ran well with a 16MHz crystal. Faster speeds caused CPU lockup.

Message-ID: <32776E6A.3EAD@icanect.net>
Source record: 218878

I'm confused, I just bought a Pro-2036 scanner from RS and after looking for any mods for it I've found None. It seems to be a clone of the Uniden BC 890XLT in every way except that the Uniden is continuous coverage and the Pro-2036 is in blocks. Are the electronics the same inside and can the RS unit be full coverage also. Im pleased with the unit but would like to get a little more out of it if possible. Can anyone help?
Thanks, Dennis

From: pro43@aol.com
Message-ID: <557ubs$ajn@newsbf02.news.aol.com>
Source record: 218879

Pro 2036 can pick up cell in the 400-512 range with this mod.Find IC 11
,locate it on the bottom of the main board(where its pins come
through).Cut
the trace between pin 7 and the base of Q17 and solder a wire to pin7 and
base of Q17.Cut the trace between pin9 and the base of Q18.Solder a wire
to
pin9 and the base of Q18.Then solder one more wire to pin8(ground).You now
need a dual pole dual throw switch(6 leads on the underside)Solder the
free
wire ends in this order.

pin9 o o base of Q17

base Q18 o o pin7

N/C o o pin 8 (ground)

BACK OF SWITCH

o = switch legs
N/C=no connection

When the switch is connecting the top leads to the center leads all is
normal.When you switch to the opposite connection or center leads to
bottom
leads the 800 BPF is hotwired on.When you search between 400-512 with the
switch in the latter position the radio picks up cell.The step is off a
little but alot is on there.

Do this at your own risk.I did it last night and listened for awhile to
make
sure it wasnt a fluke.There is about a 435 MHZ spread between what you
hear
and what the display reads.Enjoy
If you have concerns or questions e-mail me here on AOL.Ira

You should lose a small amount of respect for your source, who is passing on an urban legend (eg myth).

The whole can is pure aluminum. I have no idea how much a gallon can of tabs would weigh - but it is worth about $0.25 - $0.30 per pound at the recyclers. It does not matter whether you take them the whole can or just the tops - they just weigh what you provide.

I would recommend eliminating the wire if you can do it
without adding losses to the system. In other words, don't
add a couple more connectors to splice the ends together.
Instead, make sure all the excess cable is either at the
antenna or at the receiver (the easier option), then cut off
the excess and put on a new end connector.

Your extra loop of cable has two potential bad effects on
reception:

1 - signal loss due to attenuation

2 - signal loss due to reactance (depending on the size of
your circular loop and the desired reception frequencies)

>ligitimate authority to pass laws on monitoring.
>
Wow. I am continually amazed at how ignorant the American
public is about the way its government and laws operate.

1. No "individual" has stated that scannists are prohibited
from listening to their signals. Laws were passed by
Congress making that so. (Corporations and special
interests paid for those laws, but that is a different
debate.)

2. The FCC's function with respect to scanning is regulation
of the technical standards by which scanners are
manufactured. Under that delegated authority, they have
changed the technical specs to exclude certain frequency
bands from new scanners. They did that in obedience to a
mandate from Congress.

3. Congress most certainly does have "ligitimate [sic]
authority to pass laws" on everything. That's how our
three-part government works. Congress is the Legislative
(law making) branch that they tried to teach you about in
grade school, but evidently you weren't listening.

2705. Incredible Scanner night!

I think I got my wife hooked on scanning last night. At about 11pm, we woke up to the sound of several firetrucks rolling past the house (we live right on University Ave, a major city street). I turned on the scanner to hear a LOT of traffic on all of the PHX simplex channels, as they were fighting a warehouse fire. (You rarely hear firescene traffic on a handheld unless they are VERY close). This was about 1/4 mile from our house, and from the kitchen, I watched as several fireballs shot hundreds of feet into the air. Man, what a sight! I'd never seen anything like it except on TV! Apparently, there were several 55 gal drums of alcohol in this warehouse. We could feel the heat from this fire in our back yard! Absolutely astounding!

Well, actually it's not quite that easy...These remote monitors operate on the same principle as the "Rabbit" transmitter/receivers marketed so that you can watch TV in another part of the house without buying another cable box, antenna, etc. Mainly, it's a rabbit xmitter with a video camera attached that broadcasts to the rabbit receiver attached to the TV in the den or wherever. If you have the same type of receiver at your house, you 'could' pick up the transmission.

The other night I heard some fisherman/bootleggers using 155.200 Mhz as a chit chat channel.

The allocations in this area run in 15 Khz splits, and the nearest channel is 155.205, used here for ambulance services.

Wonder if the downsized FCC has the capacity to police interference to an ambulance company or other public safety agencies?

Wonder what kind of radios these guys are using, also?

My location is near the Gulf of Mexico, S. Louisiana, and the interference is to Acadian Ambulance Co.

It is not with a screwdriver and a scanner if that's what you wanted to
know. Chances are that you are picking up signals from other sources
such as another detector, cellular phone, security systems, etc...

2721. GET FAST CASH

Newsgroup: rec.radio.scanner
Date: 1996-10-30 00:00:00 UTC
From: gingham2@aol.com
Message-ID: <558g0q$h33@newsbf02.news.aol.com>
Source record: 218899

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!

Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like: 'desperate stupid people who will
try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new CircuitCity Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right
away. I can smell a money scam from a mile away these days...or so i thought. I believed I could sniff out a scam easily. WAS I WRONG!!...I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating: 'GET CASH FAST'!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50,000 IN CASH IN 4 WEEKS! Well, the more I thought about it, the more I became very curious.
Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe a tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that

was contained in the article. I included a small note,
with the dollar, that stated "Please Add Me To Your List."
I then removed the first position name of the five names listed
and moved everyone up one position, and I put my name in position
five of the list. This is how the money starts rolling in!
I then took this revised article now with my name on the list and
REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN
BOARDMESSAGE AREAS THAT I KNEW. I then waited to watch the
money come in...prepared to maybe receive about $1000 to $1500
in cash or so....But what a welcome surprise when those envelopes
kept coming in!!! I knew what they were as soon as I saw the
return addresses from people all over the world--most from the
U.S., but some from Canada, even some from Australia! I tell
you, THAT WAS EXCITING!! So how much did I get in total return?
$1000? $5000? Not even!!! I received a total of $23,343!!!
I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to
this!! Now after almost 8 months, I am ready to do it again!!!
Somaybe it was possible to get $50,000 in cash, I don't know,
but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must
follow through and repost this article everywhere you can think
of!
The more postings you achieve will determine how much cash will
arrive in you rvery own mailbox!! It's just too easy to pass
up!!!

Let's review the reasons why you should do this: The only cost
factors are for the five stamps, 5 envelopes, and the 5 one
dollar
bills that you send out to the listed names by snail mail
(US Postal Service Mail). Then just simply repost the article
(WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you
can.
Then sit back, and enjoy walking (you can run if you like! :o)
down your driveway to your mailbox and scoop up your rewards!!
We all have five dollars to put into such an easy effortless
investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to
$25,000
in about 3-5weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR
TODAY,
EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST
FIVE
DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T
LOSE!!

So how do you do it exactly, you ask? I have carefully provided
the most detailed, yet straightforward instructions on how to
easily
get this underway and get your cash on its way. SO, ARE YOU READY
TO

MAKE SOME CASH!!!?? HERE WE GO!!!*** THE LIST OF NAMES IS AT THE
END
OF THIS ARTICLE. ***OK, Read this carefully. Get a printout of
this
information, if you like, so you can easily refer to it as often
as
needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my
name
to your list". This creates a service out of this money making system
and
thus making it completely legal. You are not just randomly sending a
dollar
to someone, you are paying one dollar for a legitimate service. Make
sure
you include your name and address. I assure you that, again, this is
completely legal! For a neat little twist, also write what slot their
name was in: "You werein slot 3", Just to add a little fun! This is all
about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or
money
orders), and put them into an envelope and send it on its way to the five
people listed. The folding of the paper around the bill will insure its
arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR
MAILBOX. Look at the list of five people; remove the firs tname from
position one and move everyone on the list up slot one on the list.
Position 2 name will now move to the position 1 slot, position 3 will now
become position 2, 4 will be be 3, 5 wil be 4. Now put your name,
address,
zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin
boards' message areas & file section as possible. Give a catchy
description
of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT
IS!,"
or "NEED CASH TO PAY OFF YOUR DEBTS??," etc. And the more uploads, the
more money you will make, and of course, the more money the others on the
list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST
AND
BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!!
You'll reap the benefits, believe me!!! Set a goal for the number of
total
uploads you'll post, such as 15-20 postings or more! Always have a goal
in mind!!! If you can UUE encode the file when uploading, that will make
it easier for the people to receive it and have it downloaded to their

hard
drive. That way they get a copy of the article right on their computer
without hassles of viewing and then saving the article from the File
menu.
Don't alter the file type, leave it as an MS-DOS Text (***.txt) file.
The best test is to be able to view this file using Microsoft's Notepad
for
Windows 3.x or WordPad for Windows '95. If the margins look right without
making the screen slide left or right when at the ends of the sentences,
you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or"POST"
a message on a newsgroup asking how to post a file, tell them who your
Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try
to describe how to do it but there are simply too many internet software
packages with slightly different yet relatively simple ways to post or
upload a file. Just ask for help or look in the help section for
'posting'.
I do know that for GNN, you simply select 'POST' then enter a catchy
description under the subject box, choose 'ATTACH', selecting 'UUE' and
NOT 'TXT', then choose 'Browse' to go look for the file. Find your text
file CASH.TXT and click on it and choose 'OK'. Place a one line
statement
in the main body section of the message post screen. Something like
"Download this to read how to get cash arriving in your mailbox with no
paybacks!," or whatever. Just make sure it represents its true
feasibility,
NOT something like:" Get one million dollars flooding in your mailbox in
two days!" You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE
CASH
IS ON THE WAY!! Expect to see a little money start to trickle in around 2
weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!!
All you have to do is take it out of the mailbox and try not to scream
too
loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something
special
you always wanted or buy that special person in your life (or the one you
want in your life :)) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this
file again; Reposting it in the old places where you originally posted
and
possibly some new places you now know of. Don't ever lose this file,
always
keep a copy at your reach for when you ever need cash. THIS IS AN
INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN
CASH IS NEEDED!

9. (This comment added by Ron Markarian) Hell dude, this is great,
just send the money and wait like 1 week, then all of a sudden, BOOOOOOM!
Mail flood FULL of dollar bills. Hahahaha...its great

>I'm confused, I just bought a Pro-2036 scanner from RS...
> It seems to be a clone of the Uniden BC 890XLT in every way
>except that the Uniden is continuous
>coverage and the Pro-2036 is in blocks....

I tested both models last year, side by side, at the same time.
If I recall, both units have the same frequency coverage.
Specifying the coverage in several bands is a marketing ploy.

The only difference between the BC890XLT and PRO-2036 I could find
were:

1) The cabinet colors and control markings are different.
2) The squelch controls work in opposite directions to conform
to the opposite Uniden and Radio Shack conventions.

From the FAQ:

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning
knob. 200 channels, global delay. Count, AUX, and Auto
Store features. Scans and searches fast. Accepts optional
CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF
-- lots of images and birdies. Prone to severe intermod,
especially when used with an outdoor antenna. See "The
Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass,
in June 1995 Monitoring Times.

Did the ambulance company actually suffer any interference, or do you
just assume they did? If the company is actually sufferning from
interference the FCC certainly has the capacity to help - but they have
to be told about it.

Have you heard these 'bootleggers' on a regular basis? Could they be a
licensed operation some distance away that you are hearing due to
conditions?

Well,
In spite of the notice that an external antenna won't help, I do get better reception with an external whip or (better) a longwire. It doesn't directly insert a signal, but there's usually enough coupling to put a bit more signal into the ferrite rod.
This technique works for AM BC receivers too. (Wrap a few coils around the RX and earth one end and put a longwire on the other end.)
Biggest problem with the 8000 is that it really is a bit of a kludge to get it to work much below about 2000 KHz, as the sensitivity starts to really drop off. Still, getting to RX the 23 cm Amateur bands offsets that little problem....

I work at a TV station in Tampa Fl, and want to be able to hear the "Assignment Desk " on our 2-way freq. I have a handheld scanner.....

BUT I want to connect it to an external antenna (glass mount) to it and an internal power source (ie (cig lighter))

Can anyone recomend a model to me?

Having tried the discriminator output and the headphone socket,
the headphone socket works best..... but also I am only getting
PREAMBLE.... also it only seems to detect this on a 1200 transmission

I've done this on a PRO-34 and a PRO-50. Works great for me. Delay time
is halved, but scan and search speed is doubled. No other side effects
that I can see.

2731. PRO-2026 mod

Newsgroup: rec.radio.scanner
Date: 1996-10-30 00:00:00 UTC
From: "George T. Pasel Jr." <pasek001@maroon.tc.umn.edu>
Message-ID: <327742A8.43B4@maroon.tc.umn.edu>
Source record: 218909

This might be old hat for most of you but I thought I'd ask anyhow.

I just bought a PRO-2026 that RS has on close out sale now and in one of the older mod lists I found the instructions to clip L201 to restore the blocked 800mhz range. Well when I opened it up the PC board has the markings for L201, but it is no longer there.

My question is; is the newer 2026 now permently blocked or is there another mod to restore 800 mhz. I did look for a FAQ, but so far I have not found much.

Thanks for any help.

George

> What does the radio do when you enter a frequency between 100 and 500Khz?

It allows entry of the frequency and if there is a singal on that
frequency it receives it. I can receive a air nav beacon that is about
35 miles from me with a s 7 to s 9 signa. My Kenwood 440 receive the
same signal with 30 over 9 reading. So the 8000 is not very "hot" below
500 Khz but it will receive there.

By the posts I have seen, I take it that noone else's 8000 will receive
below 500 Khz? I purchased mine about 2 months ago and the only change I
did was reprogramed the eeprom to include cellular reception, so I don't
see how that would affect my ability to receive below 500 Khz.

My 8000 really does recieve down to as far as I know 184 Khz. It will
accept entry down to 100 Khz but I don't know of any signals that low to
test its receiption. I can recieve a lowfer station at 184 Khz as well
as a Air Nav beacon at 365 Khz, so I know for sure that my 8000 will
receive below the factory stated 500 KHz.

2736. Re: Ethics on monitoring cordless video.

Newsgroup: rec.radio.scanner
Date: 1996-10-30 00:00:00 UTC
From: "L.G. Shirley" <lgshirley@worldnet.att.net>
Message-ID: <327813FD.277F@worldnet.att.net>
Source record: 218914

Hello Tyler, I read the loooong line of posts and replies on the wireless video. Interesting, I posted the following in regards to the police video cams used while on patrol. But since some of it applies to the thread of your post, I'll repost it and you can gleen what you need from the article. Most concumer grade items are in the TV band or the 900HHz band.

Law enforcement has been using mobile video systems for sometime but they are becoming much more common place these days.

Most of the systems are hard wired video. A tape system is usually locked in the trunk of the car. Locked in a bullet proof, tamper proof box in some instances. Some devices will not permit the removal, rewinding or taping over of the tape except by someone offically charged with the duty, to preserve evidence.

Cameras are generally mounted fore and/or aft. You may spot one mounted at the top of the windshield near the rear view mirror. I've seen some mounted on the dash. Besides wireless mics, they also have front cab and rear seat microphones. So you better be carefull what you say once you're inside the car.

STS Skaggs Telecommunications Services, Inc makes a unit called the Visual 3000 System. It has a touch-sensitive video screen. The officer can activate the video cam or lights and siren by touch. The wireless "body bug" as they call it, can be activated from a remote location and can record from distances up to 1,500 feet.

The freq's of the wireless mics will depend on who built the system and when it was built. The older 169.445, 169.505, 170.245, 170.305, 171.045, 171.105, 171.845 and 171.905 are falling out of use as the newer bands are employed. However, I do wonder how many older systems may be on the 8 above freq's. (some monitor buffs have reported these in use by PD)

The 174-215 band that TV and Radio stations generally use are certainly a possiblity. The 902-928 band has quite a few wireless mics in it. I've seen an old Sony wireless list posted in the past and have found 914.000 being used by someone as I commuted to work one day. Never did find the user. However, it did occur in Milltown, NJ and Milltown PD has a video system.

Here is an old list posted in a NG, I know the individual who posted it collects data like this and it's probably quite accurate. If anyone has a list of wireless mics to share, add it to the thread.

902.750 904.000 905.000 908.250 908.500 909.000
909.750 910.750 911.000 912.750 914.000 914.250

914.750 915.750 916.750 917.250 918.500 919.000
921.000 921.500 921.750 925.000 926.000 927.250

As for the "real thing", a wireless audio and video system, there is a company that markets one. "COPCAM" is a wireless audio/visual system that has a camera lens that clips onto the officers shirt. I've seen photos of it worn about shirt pocket level.

The lens is probably a 4mm type which will yield a wide field of view showing the occupants in the car and the interior of the car. (Police Video Systems offers a variable 6-12mm focal length lens.)

The transmitter is about HT sized and is worn on the officer's belt. It transmits in the 902-928 band but does not receive, only transmits. There are both B&W and color cameras available.

Everything the officer sees and hears is transmitted back to his patrol car and recorded on video tape as evidence.

The same company also offer a TrueSound stereo audio transmitter. It works in the 902-928 band but they will be offering a 2.4 gig item shortly.

Years ago I noticed the availability of wireless mics and video transmitters starting to grow. I recall saying that video surveillance would become one of the hottest items in 1994 and indeed it has, especially these days.

Most of the "consumer grade" transmitters are now in the 902-928 band. I've seen plenty of them on the market, let the consumer beware, most are junk no matter what the price.

As this band becomes more crowded, the 2.4 gig band will becoming the band of choice. Currently the DEA and ATF use the 1850 band while the FBI in NJ uses the 2250 band for their video surveillance cams, but they are suppose to be moving higher.

Some devices available are from Hutchnet which markets a 2.4 gig covert system w/up to 5 watts of power. It uses directional antennas for long distance.

Advance Digital uses a transmitter on 915 MHz, 50 millivolts @ 3 meters. Also a covert system. They too offer a 2.4 gig system.

Micro Video Transmitter World has transmitters on 434 Mhz, TV ch 32, 46, 47, 48, 49 and 900 MHz. Most of the early consumer products transmitted on ch 52 but also offer several other channels if you had a special request.

Micro Video out of Canada is on 902-928 and 2.4 gigs. JJC, Inc offers a 2.4 gig unit for $795 using Yagis and a 4.3mm lens. Micro Video Link out of London has a covert 100mW unit which is one of the smallest ones I've seen. These are aimed at you and me to guard the home or whatever you want to do - just don't get caught.

Dr. Pepper:

If you are not asking for money, then I must assume that you have enough money to undertake such a trip. I really think that with all the problems in the world -- hunger, homelessness, the general moral and ethical decay of our society -- it is wasteful and disgraceful that you would spend your time and energy, lurking around in Nevada with electronic equipment, like some ridiculous character in a Boris Karloff movie. I really think that if you have the energy to do such a thing, then you should learn to expend it in dealing with things that are going to help our world to progress.

MESSAGE:
HI.
Hi.
I got the wideband reveiver pre-amplifier' and 'camnis hsc-050 scanning
reveiver'.
They are hooked up to my wheelchair. I am disabled person and
I am in a electrical chair.
I have a problem. Every time I move ,i am getting static coming through
the scanner. ALSO Either I not move around now and
when I take the pre-amplifier off ,but
It still does it. Is there anything I can do to Fix this problem ?

Ps I used to have the uniden 200xlt scanner, and I used to have the
Uniden 200xlt and m-75 pre-amplifier hooked up together,
no static coming through on the uniden 200xlt Scanner.

LET ME KNOW SOON YOU CAN PLEASE

PLEASE REPLY BY FAX ON THIS FAX NO. 060 561596 AT HOME

BEST REGARDS....THANK YOU....CARLO

What frequency, mode and power?

I've got a diagram of a simple one, about the size of a postage stamp,
which does world wide A1A mode, 160 meter QRP transmissions, and uses very
few parts... sounds like just what you are looking for.

>just plugging into a headphone/speaker jack simply won't fly...

Actually it will, albeit not as well as a direct connect. Either Semasoft
or PD will function with a simple audio connection interface but PD is
the only one that really allows 'direct' data input since Semasoft uses a
sound card....

Cheers, Luke.

Hi all. MTV has been advertising a "phone" called the V-link phone. It looks like they are targeting the highschool crowd. They're pushing it like a cellular phone, they say its a great party line and you never get a phone bill. I realize its not a phone, I'm just curious what the frequencies are that these things use and how they work in order to get the party line effect. Thanks for any information you have, web searches have returned nothing.

Bear in mind that the AR8000 was not designed for shortwave reception.
It's designed for everything (well almost everything) above 30MHz.
Think of the shortwave ability as a bonus! I find it to be at least
as good as my Kenwood R1000 table top shortwave.

: boost to portable cellphones?
: --

The antenna does not actually create more power. What it does is channel the radiated power so that more of it emanates horizontally and less towards the sky. Generally, you want to use an antenna like this when you are in a rural area, not when you are in a city. In a rural area you are likely to be further away from the towers.

Jim,

One of the best resources on the internet for frequency information, which I just posted the othernight in alt.radio.scanner, is the WEB site [www.perconcorp.com/db_srch.htm]. It also helps if you search by the name of the "county seat" (city name) because that is where the sheriff departments are usually located, as well as State Police agencies. Take a look at it and let me know what you think,

> person who's not on the cell phone's audio being cut out (detectable
> from the quick cutting in and out of background noise from the non-
> cell user's phone). Why does this happen?

When you are listening to the cellsites transmit frequency you will
often hear the cellphone's audio being sent back out with the "distant
end's" audio. This is to provide "sidetone".

Sidetone is the user's transmited audio fed back to his receiver so he
can "hear himself". When you pick up a regular telephone you can
usually hear yourself as long as there is "battery" on the line - even
if you don't get dialtone. The sidetone levels may differ from channel
to channel for on reason or another. Additionally, if a cellphone's
transmit deviation is low it will result in lower sidetone.

The main purpose of sidetone is to help the caller determine how loud to
talk. Low sidetone will tend to make people talk louder (like when your
teenager yells during a normal conversation when they have their Walkman
headset on - they can't hear themselves so they tend to talk louder.)
High sidetone will tend to make a user speak more softly.

Regards

We are invading Little Rock this weekend for coverage of Clinton's election nite stuff...

You should be listening like crazy to the 450.xxx and the 455.xxx...CBS will be putting up several radio systems...a repeater for engineering...one for operations and one for citywide IFB. That one will transmit programming all the time and be interrupted for directors to talk to on camera talent...

ABC always puts up the same kind of thing...

I believe NBC does the same, but have never worked for them, so don't know for sure...

I will post freq. here as I find them out...

If you can get near the festivities, we use wireless mics in many ranges...a lot in the 169-174 range and then a bunch on oddball UHF freq.

later...cleve

: Does anyone know what is the purpose (or cause) of the super high pitch
: tone you can hear on a cellular frequency? I'm talking about the one
: that is so high its equivilant to what you hear when your ears are
: ringing; maybe even higher. :) I've noticed this on ALL cellular
: frequencies when there is a carrier present, and NEVER on any non-
: cellular frequencies I monitor.

It's called a signalling tone (ST), it is a 10Khz tone used by the cell tower to control the operation of the phone. Often it is repeated 5 times. A buzzing noise, another signal you hear, is a burst of data. This is used by the tower to command the phone to change frequency or power. It is also used by the phone to signal the tower it is starting a call, and to identify itself.

: Also, what is the cause of the cellular phone owner's audio not being
: heard? In some conversations, its quite low in volume, and in others,
: both parties are equal in audio level. But for some you will never
: hear the person with the cellular phone talking at all. Apparently,
: in this case, when the cell phone owner speaks, you can hear the
: person who's not on the cell phone's audio being cut out (detectable
: from the quick cutting in and out of background noise from the non-
: cell user's phone). Why does this happen?

Cellular systems are duplex, which means there are two freqencies, one from phone to tower, and one from tower to phone. Each frequency is primarily responsible for carrying one side of the conversation. But in many cases, the tower "repeats" the cell phone signal, this enables the person talking on the phone to hear themselves. But towers sometimes do not repeat the base signal, it depends on what mode they are operating in. I am not sure of why the operating mode of the tower changes, however.

Jory,

My AR8000 receives down to 100 Khz as well. I don't have the manual
with me but I think there's some sort of disclaimer regarding
sensitivity below 500 Khz. I can pick up the local PDX Airport Beacon,
but that's about it for below 500 Khz. BTW, my 8K is of fairly recent
manufacture as well...

By using a traditional TV! Just pick up an older TV with a UHF tuner
that goes up to channel 83 and you also have a cellphone monitor
(albeit illegal).

Can you please fill me in on the Pro's and Con's of this model please. I am about to purchase one second hand for $450 $NZ (New Zealand) Which equates to about $230 $US. Is this a good proice for this model (second hand).
I am not a totally a newbie, do know a very terminologies, but not the really technical ones please.
Thanks in advance for any replies.

If you go to the Motorola site, www.motorola.com , there are images in their text that you can get. You may have to pick them out of your Cache directory though, but they have pictures of most all of their current equipment along with specs.

I don't know about the source of the tone you're talking about, but I know what you mean.
It seems to me that the "better" scanners, like the pro-43 don't seem to have this problem. My older pro-37 definitely has it, and so does my even older pro-2004, but to a MUCH less extent than than the 37.

If you use an audio filter such as the RS - DSP unit, or other type of audio filter you can eliminate the noise entirely.
cheers

2792. KENWOOD TH-79AD(H) MODIFICATION SUCCESSFUL

Newsgroup: rec.radio.scanner
Date: 1996-10-31 00:00:00 UTC
From: laast21+@pitt.edu
Message-ID: <55ag9d$a2f@usenet.srv.cis.pitt.edu>
Source record: 218778
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner,rec.radio.amateur.misc

I've seen questions regarding this in all three forums, so I've crossposted.

Very recently picked up a Kenwood TH-79AD(High-Power) handheld. After searching the net for a day, and finding out not much of anything, I decided to experiment. I'm sure all of you have been looking.

The serial number (date code) on the radio is 7040-something. Brand new unit.

Despite what the original author believes(talked with him yesterday), the published mod for the 79a *DOES* work. I have a couple suggestions to add though.

First, the original mod suggests that you remove the ribbon cable. From the people who have tried this method, it seems as though they have problems with their keyboards. Chances are, the ribbon cable (which incidentally is *really* thin) is probably not being put back correctly. Suggestion #1 - LEAVE THE RIBBON CABLE ALONE.

Next, There is the MARS/CAP modification that tells you to CUT the green wire. From what I've seen and heard, you can only do the MARS/CAP modification or the wideband modification. In my opinion, unless you need specific access to 420-438mhz, I'd leave it alone. I simply did the wideband modification. I'm not going to repeat(or look up for that matter) what freq's it opens up, but I'm summarize the results. EXTENDED RECEIVE AND EXTENDED TRANSMIT.

I talked with an electrical engineer who did surface mount tech work for Panasonic. If you don't know what surface mount tech involves, THINK small. Not just small, tiny tiny tiny. He used magnifying glasses, special lights, and even microscopes to work on some units. It requires special tools.

The people I've talked with have had problems trying to desolder this diodes. THEY ARE WAY TOO SMALL AND TOO CLOSE TOGETHER.

Now listen, I'm just a regular kid off the street. I've assembled heathkit projects, and built little tone generators and the like. I don't have any surface mount experience at all. I certainly don't have the tools or the skill. After talking with this tech, he suggested that I cut the diodes off the board with an exacto knife. Didn't have one of those either. So I used one of those tiny flat head screwdrivers you buy at Radio Shack.

VERY CAREFULLY, I took the screwdriver and pressed down firmly on the legs of the diodes. This literally cut the diode from the leg soldered on the board This would normally sound hard to do, but remember these legs are a FRACTION of a millimeter. After that, I used tweezers to pull the diode off the board. BTW, the diode is glued to the board, but a firm pull removes it. I did this to the two diodes. I removed both diodes cleanly. No damage at all to the

PC BOARD.

Put back the four screws, turned on the unit and blam-o. One modified unit.

Think this is a fluke ? Think I got lucky ? Nope. A friend brought his 79AD(H) over, and he performed the mod exactly the way I had mine. BOOM, clean removal, no problems. No keyboard problems, no iradic operation. Just a clean uncensored radio.

This is not meant to be a standalone mod. Use this message as an addendum to the original modification document. Its like rel 1.5. The filename everywhere is '79a.txt' in the Kenwood directory under mods. The file structure is basically setup the same everywhere, whether it be FTP, HTTP, or gopher. mods/kenwood/79a.txt. Searching a web engine like http://www.altavista.com or http://www.lycos.com or http://www.yahoo.com will definitely yield results.

Hope this answers any questions. Thanks to Renegade.

>Which equates to about $230 $US.

When you buy a used radio. Check each corner for dents.
A radio which is dropped will almost always fall on a corner
first.

From the "Buying a Used Scanner FAQ:"

PRO-26: 1995 vintage. Very good portable made by for Radio
Shack by Uniden. 200 channels, very fast scan/search. Good
display. Covers all TV channels, but spectrum adjacent to
cellular phone band is censored which prevents monitoring
parts of some trunked systems (e.g., IL State Police
district 4). Up to 50 frequencies can be skipped during
search. Limited image rejection causes 929 MHz paging
interference in 170 MHz range. IFs are 380.7/254.4, 58.075,
and 5.5/0.455 MHz. Audio suffers from small speaker. See
"The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by
Bob Parnass, AJ9S, in Monitoring Times, August 1995.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel
portable with 20 banks. Up conversion. Very fast scan,
search, and intelligent Auto Store. Mode, attenuator, and
delay settings programmable for each channel. 50
frequencies can be locked out during search. Larger speaker
than PRO-26 produces better, crisper audio. See "The Uniden
Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring
Times, April 1995 and "The Radio Shack PRO-26 vs.
Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in
Monitoring Times, August 1995.

Reprints of articles from Monitoring Times are available
for $2.00 each plus a self-addressed stamped envelope from:

Grove Enterprises, 300 S. Highway 64 West, Brasstown,

>> decided that it would be better to slow it back down. I did and it works

I did this to my pro34 years ago. I found that any crystal over 4 MHz
would not work. A TV crystal (3.55...) should work fine and give you
a modest speed increase over the standard 2MHz crystal.

>> My question is this. I also have a PRO2006 and have thought about
>> doing this mod, but have never done so based on my previous experience.
>> Has anyone else ever had this problem? Are you satisfied with your 2006
>> speed modification? Thanks in advance.

This involves cutting a diode that will speed the scan from 26 to 30 cps.
It works fine. The other speed mod changes the crystal from 12 to 16 MHz
(I think) and although I haven't done it, I've never heard anyone
complain about it NOT working.

David

Interesting. Same reply in several groups. Is it possible for some lame jerk to write a program which ramdonly attaches to several post with the same reply (Like one of those cancel-bots which randomly cancels thousands of usenet messages?) It would be an interesting way to start flames without actually having to read any groups...

Either that, or this guy has a *lot* of time on his hands to be making juvenile anonymous posts...

You are likely hearing what is called SAT (supervisory audio tone). I
beleive this is supposed to be an "out of band signal" but you can
usually hear it. It's about a 6 KHz tone if I remember correctly. It
is one of the signals used between the cellsite and the cellphone to
keep the call up.

Regards

>
> Brian Petersen
> brpeter@ix.netcom.com--------------------
Brain, This tone is called an SAT or Supervisory Audio Tone. It can be
5970Hz, 6000Hz or 6030Hz.

It is used to verify the complete (loop) audio path from the Cell-site
to the mobile and back. This allows the cell-site to ensure that the
channel has been captured and also allows for continuous loop-check.

The mail purpose is to verify the mobile or portable has captured the
channel and the site controller continuously monitors the the SAT and if
the site does not detect SAT for usually more than 3 seconds it
disconnects the channel.

It is also used to verify correct handoff. eg. the site will send info
to the mobile telling what channel to switch to and what SAT to
transmit, it verifies that it has rcvd to correct mobile at the new site
by seeing the mobile come up on channel with the correct SAT.

Hope I've Helped

>Thanks for any help.

>George

The newer units built after April 1994 do not have an L201, and cannot
be "unblocked" because the microprocessor code was changed to
eliminate that capability.

The date code on the box and rear of the scanner looks like this (I'll
use mine for example):

11A3

The number to the left of the alpha character is the month of
manufacture, the number to the left of the alpha character is the
year. There is no indication of which decade, only the year within
the decade.

So, mine was built in November 1993 before the restrictions were put
into place. If yours is 4A4 or later (April 1994), then you have a
unit that does not have this capability in the first place, so there
is nothing to "unblock".

Does anyone know what the average time for the turn around of a GMRS license? I sent mine in about two weeks ago and it hasn't arrived yet.

Thanks in advance!

Andrew

Well, to be off-topic for a minute: What makes your ideal use of HIS money better than his use of it? If you want to do something noble with the money, earn it yourself.

Gentlemen, I think it time to call it an end to this little flame-fest.

the following was sent from me to john and I wish to let others now how
I feel.

**********begin**********
John Mackey wrote:
>
>
> How many times have you heard a referral made to the Bill Cheek ass
> kissers?
> For a typical example see the recent post from "Flatted5th".
is that all? just one example? There were only 2 people in the Entire
newsgroup that had anything detrimental to say about Mr. Cheek (besides
you). Still, three people against 200... hmmm....

>
>
> Must take one to know one.
True, so how well do you know me?

>
> > facts are this:
>
> Hmmm, lets put this into it's proper perspective. I was booted off
> Scanradio with MANY others who were NOT Bill Cheek ass kissers only a few weeks
> after Bill became the moderator. In ALL my time on Fidonet, that is the ONLY echo
> I have ever been kicked off of. (I have been subscribed to as many 27 groups at
> one time)
Funny, its seems (and I was there) that you made big bones about him and
wouldn't stop. Remember John, I am on fido as well.

>
> I'll send you a few examples of what was happening at that time & the
> opinions of those involved. You obviously are getting into areas where you know
> no knowledge.
Do not impune my intellect, john. You have no idea where I have been (or
even who I really am (besides what little data you have from the
newsgroups, QRZ, and other sources... You have no clue as to who I
really am.... I was there and I remember much (even though I didn't post
often).

>
> > 2. you are seeking revenge for that
>
> No, just keeing him in decent order now. Yea I did mess with him for a

> while a few months ago but that was some time ago.
Ah, so, you ADMIT to having a little "fun". Now the facts start to come
out..... However, you still continue with your old habits (as though I
wouldn't recognize tactics like those).

> I was thinking the same about you.
Think? Did I just hear the word THINK escape your lips?
Why don't you THINK about it, John. You have much to think about. Why is
it that whenever you get on a newsgroup, the first thing you do is
impune someone's character and use profanity? Think about it. HAve I
used profanity, or otherwise insulted you with barnyard feces?

>
> Yea, you're right. It is hard to forge a destination path. But,
> Pacifier gives free trial accounts WITHOUT phone confirmations. So, ANYONE could
> have done it. All I know is I DIDN'T do it. Now honestly, with all the
> bullshit that has gone on & the stuff I have been in WHY would I lie??
Hmm, didn't know many isp's that would do that.... In fact, very few
ever do, because of the problem of net abuse. Also, you seem to have
used profanity again... Why don't you clean that toungue up, john. I get
real tired of those who cuss. Also, it does nothing to solidify your
position....

>
> > Do you have the right to make personal attacks upon his (or others)
> > characters. No. Its called slander and libel.
>
> Then why haven't you taked that issue up with Bill. I totally agree
> with you. You notice I DO NOT attack Bill on his knowledge. So I wonder why
> he attacks on EVERYTHING like saying my kids are bedwetters (I have no
> kids), & advertising my phone number on the NG - a big NO NO. (that must
> have been tough since my phone number is LISTED in the white pages). He
> did similar things to PJB, Hugh Duff & others.
No, that is between you and him, and I remeber a few of your remarks
that got that ball rolling (there you go, underestimating my memory for
the facts).
Still, it was wrong of him to do that, but that is an issue best left
between you two. However, you have responded to me and impuned my
character with some of your remarks, and that will not pass.

>
> I did, if you dont' want to believe it, that's OK, it's your choice.

Yes, it is my choice, but you still haven't provided it in sufficient
quantity for other than a cursory glance (and mostly, it is hearsay). I
cannot judge on hearsay... You will have to do better.

>
> Funny, I have been in Communications for over 10 years & never heard
> of the guy until I came to Fidonet the 2nd time, then again on the
> internet.
Go to the libraray and look him up under author/title... You will see 4

published works and a biblo of several other references....

> FACT: He WAS NEVER confirmed to be a member of Mensa. He did initially
> say he was a current member, THEN changed his story to say he was not
> active? The Mensa office confirmed that he IS NOT a current member of
> Mensa, thereby proving he was not speaking factually.
How would you know, unless you happen to have that pin and know a few
people? Also, it helps to be discreet. I am not a brahma bull trashing a
china shop here.... If you know who to talk to, and how to talk to them,
you can get all kinds of information. think about it....

>
> > FAct: Mr. Cheek has demonstrated a competant knowledge of scanners (and
> > electronics in general).
>
> Well, at least in scanners, not in general electronics. As a ham you
> certainly know that using a mettalic tuning tool on RF circuits (like
> caps & coils) is a BIG mistake that any novice would know better of.
> This is a recommendation that Bill made only a few weeks.
Funny, before I was blind, I used some of those techniques. they got me
into the ballpark on tuning most radios (granted, you have to account
for the extra inductance, but it will work). However, it is not
recommended, but it is useful when the tools you have aren't quite up to
the task.

> FACT: Mr Cheek has NEVER been able to provide a single shread of
> evidence to support him having ANY degrees (he claims to have dual
> master's degrees).
Its easy to check.

>
> 2nd FACT: Mr Cheek alternately identifies himself as a "Logistical
> Engineer", "Chemical Engineer", "Electronic Engineer, & "Electrical
> Engineer". These numberous & different titles he uses further
> leads someone to question as it is nearly impossible for someone
> to be engineers in these similar, but DISTINCTLY different
> discliplinaries of engineering. He can NOT demonstrate having
> a government license or accreditating certification in ANY
> field of engineering.
Most fields of engineering often have subsections that are learned by
all in the "engineering disciplines". It isn't all that hard to obtain
additional credits toward other sub-disciplines, john. Also, since you
called this whole issue into question by making the accusation, it is up
to you to shoulder the burden of proof, not Mr. Cheek. I therefore leave
it in your hands.... It is up to you to prove, to yourself, that you are
right. Then this proof must stand up under aggressive examination by an
impartial party. See what I mean. YOU HAVE TO PROVE IT, john. Its that
simple.

>
> > His history is known. However, yours is not.
>

> So what's your point?
Point is, he has evidence (hard evidence) of his knowledge, whereas, you do not. It is quite conceivable that you might be as good (or better), but without real evidence, who am I to believe? Who is anyone to believe
>
> > I don't want to hear the whining.
>
> Funny I was just thinking the same thing about you.
Is that the best you can do??? I think a more appropriate comment would go like this:
"hmm, perhaps you may be right, but consider your position before calling what I have to say as 'whining'.". Now, doesn't that sound more professional?

Eric.

Would like to trade for scanner (or sell / PREFER trade) A very nice DX-160 general coverage receiver. I had offered this unit recently and indicated that the dial had a minor problem. The tuning dial cord was loose from age and is now fixed. Radio looks and sounds great. Date of mfg. is January 1977 according to the folks at Radio Shack customer service. My interests would be in the area of Realistic hand-helds such as: Pro-44 ('94); Pro-46 ('94); Pro-51 ('95); Pro-23 ('95) OR Tabletops: Pro-2030 ('94) Pro-2026 ('95) Pro-2004 (real old) OR What have you to offer in trade. If trade doesn't work out, make reasonable offer.
Regards,
Ray Miller N2NJK

2846. Easy Money!!!!!

Newsgroup: rec.radio.scanner
Date: 1996-10-31 00:00:00 UTC
From: Manager <TRIXER@FLASH.NET>
Message-ID: <01bbc6c9$78b9f6c0$e0d2c2d0@trixer-s>
Source record: 218864

This is the best way of getting fast money, in an easy, honest and legal way too.
Read this message and be sure of what I am saying.

THIS IS THE FAIREST MOST HONEST WAY I KNOW OF TO SHARE THE WEALTH!

Hello! Would you like to make thousands of dollars, quickly, legally, with NO CATCH? Then keep reading....please take five minutes to read this article it will change your life, just like it did mine. It's true! You can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner! I SWEAR IM NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested, keep reading; if you're not, I apologize for waisting your time.

Here we go. A little while back, I was browsing through these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars in weeks with only an initial investment of $5! So, I thought, "Yeah, right, must be a scam", but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1 to each of the 5 names and addresses stated in the article. You then place your own name and address in the article at the bottom of the list at #5, and post the article in at least 200 newsgroups (there are thousands). No catch, that was it!

So after thinking it over, talking to a few people first, I tried it.

I figured what have I got to lose except for 5 stamps and $5, right?

Well, guess what...within 7 days, I started getting money in the mail!

I was shocked! I still figured it would end soon, and didn't give it another thought. But then the money kept coming IN, tripling in size and multiplying by 10-20 times the amount that I got the first week! In my first week, I made about 20 to 30 dollars. But by the end of the

second week, I had a mad total of over $1,000 dollars!!!! In the third week, I had over $10,000 dollars, and it's still growing. This is now my fourth week (Oct 11) and I've made about $42,000 TOTAL, and the money is STILL coming in.....

***This is the good news for the author of this article, this is not my history. I am just now(10/21) posting this article. When I start receiving

money I will update this article and inform all of my good fortune. I am not going to lie to you, I am giving it a shot and I think you should too, hey, it's certainly worth five bucks. We spend that on the lottery. Let me tell you how this works and most importantly, WHY it works...also, make sure you print a copy of this article NOW, so you can get the information off of it, and begin making money.

The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 separate pieces of paper and write the following on each sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER 4." Get five $1 bills and place ONE inside each piece of paper that you just wrote on, and fold each piece of paper so the bill will not be seen in the envelope (otherwise, nosey people who like to steal envelopes with money in it will get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5 envelopes sealed, EACH have a piece of paper AND a $1 bill stuffed inside of the paper. Make sure those words that were stated above are stated on each peper. What you are doing is creating a service by this, this is PERFECTLY LEGAL. Now then, mail the 5 envelopes with paper and $1 in each to the following 5 addresses:

1. N. North, 1301 Kingsway Dr. #14, Picayune,Ms. 39466

2. D. Buff, 6503 Whispering Oaks, Wharton,Tx. 77488

3. S. Shaw, 611 23rd Street, Sacramento,CA. 95816

4. M. NAWLO, 27 CROWS NEST LN. # 17, Danbury, CT. 06810

5. M. Vandergriff, 4003 Red River # 206, Austin, Tx. 78751

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becomes 4, 4 becomes 3, etc.) and put YOUR NAME as number 5 on the list. You can slightly alter this article if you need to, editing what YOU need to edit.

STEP 3: Post your amended article (with your name at #5) to at least 200 news groups (I think there's close to 18,000 of them). All you need is say, at least 200. HOW TO DO THIS: If you have Netscape 3.0 do EXACTLY the following:

1) Click on any news group like normal, THEN click on 'TO NEWS', which is on the far left when you're in the newsgroups page. This will bring up a box to type a message in.

2) Leave the newsgroup box like it is, CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH"!!!

3) Tab once and you should be ready to type. Now, retype (only once) THIS whole article WORD FOR WORD, except to insert your name at #5, and to remove #1 off the list, plus any other small change you think you need to make. Keep almost all of it the SAME!

4) When you're done typing the WHOLE article, click on FILE in THIS BOX, RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST BOX. Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to number 5 below.

5) If you still have all of your text, send or post to this newsgroup now by just clicking send, which is right below FILE, and right above Cc:

6) Here's where you're going to post all 200. OK, click on any news group then click on 'To News', again in the top left corner. Leave the NEWSGROUPS BOX alone again, put a flashy subject title in the SUBJECT BOX, hit TAB once so you're in the body of the message, and then click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find YOUR file that you

saved; click once on the file, and then click OPEN; now click on OK; if you did this right, you should see your file name in the attachments box, and it will be shaded green.

IF YOU USE IE EXPLORER IT'S JUST AS EASY...HOLDING DOWN THE LEFT MOUSE BUTTON, HIGHLIGHT THIS ARTICLE. THEN PRESS THE "CTRL" KEY AND THE "C" KEY
AT THE SAME TIME TO COPY THE ARTICLE. THEN PRINT THIS ARTICLE FOR YOUR RECORDS TO HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1 BILLS TO.

NEXT, GO TO THE NEWS GROUPS AND PRESS "POST AN ARTICLE" A WINDOW WILL OPEN. TYPE IN YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK IN THE LARGE WINDOW BELOW. PRESS "CTRL" AND THEN "V" AND THE ARTICLE WILL BE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO AND THEN HIGHTLIGHT AND COPY IT AGAIN. NOW EVERYTIME YOU POST THE ARTICLE IN A NEW NEWSGROUP ALL YOU HAVE TO REPEAT "CTRL" AND "V" AND PRESS POST.

7) That's it. Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups, you see? Now you just have 199 to go!! (Don't worry, each one takes about 30 seconds, once you get used to it) REMEMBER 200 IS A MINIMUM. The more you post to, the more money you will make.

AND THAT'S IT!!! THAT'S THE ONLY 3 STEPS THERE IS!!!!

You are now in the mail order business and will start receiving your $1 envelopes from various people all over the world within days. HINT: THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILL MAKE. You may want to rent a PO Box eventually because of all the mail. If you wish to stay anonymous, you can come up with a name, such as "manager" or "investor". Just make sure all the addresses are CORRECT, please.

LET ME TELL YOU WHY THIS SYSTEM WORKS!!!!

Out of every 200 postings, let's say I ONLY receive 5 replies, which is actually VERY LOW. So I made 5 dollars with my name at #5. Now then, each person who just sent me $1 makes, say only 200 postings, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. 50 people send you $1 now; thats $50 you just made! Now, then your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, OR 10,000 POSTING (50X200). Average return is 500 at $1 each is $500.

They make 200 postings each with your name at number 2, which is 100,000 postings, which is 5,000 returns at $1 each, which is $5,000 dollars! And finally, 5,000 people make 200 postings each with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000 BEFORE YOUR NAME DROPS OFF THE LIST. AND THAT'S IF EVERYONE MAKES 200 POSTINGS ONLY, AND IF ONLY 5 PERSONS RESPOND!!!!!

When your name is no longer on the list, you just take the latest posting that is appearing in the newgroups, and SEND OUT ANOTHER $5 TO THE NAMES ON THE LIST, PUTTING YOUR NAME AT NUMBER 5 AGAIN. And start posting again. The thing to remember is, do you realize that THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOING THE INTERNET AND READING THESE ARTICLES EVERYDAY, JUST LIKE YOU ARE RIGHT NOW!!! So can you afford $5 dollars and see if it really works? I think so.....

People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are TONS OF NEW HONEST USERS AND NEW HONEST PEOPLE who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with THOUSANDS of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this WILL WORK, I PROMISE YOU!!! You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newgroups to make sure everyone is playing fairly. REMEMBER, HONESTY IS THE BEST POLICY. YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE MONEY!! GOOD LUCK TO ALL AND PLEASE PLAY FAIRLY AND YOU WILL REAP THE HUGE REWARDS FROM THIS, WHICH IS TONS OF EXTRA CASH.

** By the way, if you try to decieve people by posting the messages with your name in the list and not sending the money to the people already on the list, you will not get as much. Someone I talked to knew

someone who did that and he only made about $150 dollars, and that's AFTER seven or eight weeks! Then he sent the 5 $1 bills, people added him to their lists, and in 4-5 weeks, he had over $10K.

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME!!!!!!!!!!!

the Diagnosis Murder TV Show is on location today in El Segundo, CA (near LAX) shooting at El Segundo High School -- i've been searching the range 173.2 - 173.375, but i haven't heard any traffic so far.

i'm also searching the 450 - 512 MHz range, because they might be using one of those low-power splinter freqs.

is there a comprehensive list of ITINERANT frequencies available?

thank you!

> P.S. Outdoor antenna's are out of the question (housing regulations). Since you live so close to the airport, I don't think you will have any
trouble at all hearing the tower; and it is likely you will hear at least
some of the aircraft on your local approach/departure freqs as well.
Of course, a ducky is quite lossy at most any frequency; a little
ground plane mounted say in a window or on a porch (I think the lengths
are around 26 in or so) that could be removed when done may be a help
here...73s Mike

This one has the most converage of DSS vs. Prime Star. Beware the group should be called alt.grumpy.old-men or alt.literal.minded. Think 3 or 4 times before posting about what you're going to say. Your words can be fed back to you in a manner that's not quite as pleasing as a politcal attack ad.

Also there's several web pages on the matter. Both DSS and Primestar have pages. Dump Direct TV and Primestar into your favorite search engine.

> Former Field Technician with Bell Cellular

Brian, Ron hello. Ron's explanation was superb on what the tone is and
how
it's used.

They've got three different SATs (they could have used only one) to make
my life easier - when push comes shove in laying out and operating a
large cellular system.

What it comes down to when using 21 frequency-groups in a 7 cell re-use
pattern (called a 7/21 system) only 19 (and only 18 for groups 18/D3
through
21/G3) channels per sector (assuming channel stuffing or stealing
channels
from other frequency groups has not been done) are available in an
analog cellular system. Here in Dallas with the implementation of
Digital
the max (normally) of analog chs 15 to 16 analog channels per sector.
Digital is a different beast entirely and does not rely upon just 3
SATs.

Now back to 3 SATs. Any given A or B band cell system only has 416 chs
to
use (A + B band = 823 chs). So, 7 cell sites can be laid out before any
frequencies have to be re-used. The 8th cell will have to use the same
'frequency group' as the 1st cell. In Dallas we have over 300 cell sites
(in a a 12 county area) so their ends up a LOT of freq re-use.
Thankfully
somebody decided that at least 3 SATs, as Ron desribed, were needed.
Some
days I wished there were 4, 5, ot 6 SATs. So when I designed a cell site
and made the tough decision as to what freq group to use (and
consequently
which sites I could/would interfere with) I did a quick study to see
what the best choice for SAT was too. And like Ron wrote this is used
in the handoff process - important to keep the 'dropped call rate' low!

> > Also, what is the cause of the cellular phone owner's audio not being
> > heard? In some conversations, its quite low in volume, and in others,

> > both parties are equal in audio level. But for some you will never

I've got the answer for this one (Ron got the SAT one). There is no provision in the BS (base station) or the MTSO (the 'switch') to transmit the mobile subscribers audio on the 'downlink' path (the radio path from the cell site to the cellphone). 'Sidetone' is genned locally in the phone to the subscribers earpice. Now, when the cellphone's user's
voice is heard it's because of poor landline 'return loss' - usually an analog POTS line with a mismatch (and POTS lines are always mismatched).
The cases (and you can test this) where you can't here the cell phone user's voice is when all digital trunks and PBX's are being used and an analog POTS line is not part of the picture. Like when you call the office
and it's an all digital circuit and when you call home it's via a POTS line.

Hope this helps.

Regards, Jim

Can anyone please help me with a magazine regarding scanners. I need a magazine so can someone please give me excact name and adress of a magazine which deals with scanners. If you are working on a magazine feel free to send me a free trial issue but please e-mail me if you have knowledge of a scanner magazine.

Mr. Karsten Jensen
22, Sdr. Eng

I have a Pro-37 and it is a kick ass scanner. It of course can be cellular restored. It is 200 channels and very sensitive. 30 mhz to 960 Mhz with some cuts, but it has all the air including military air band. If you paid 15 bucks and it works you got a hell of a deal! It was around $350.00 new when sold. Much better than R/S's current unmodifiable handhelds. Take it in to Shit Shack and have them calibrate and realign it for around $40.00, and you'll be REAL happy with it. I take mine in once a year and have it tuned up. I bought the 5 year service contract, so it's all free to me, so I'm just guessing at the tune up price. might be less, prob. not more $$. I had to have the speaker replaced once, and the key lock quit working, but otherwise it ROOOOLES! I find it hard to believe Goodwill had a scanner, especially a Pro-37 for $15.00. But... it's great if they did. All new scanners suck as they can no longer be restored for cellular reception. And Bearcat scanners are shit, only thing worse are those garbage Icom overpriced pieces of SHIT. Have fun listening to pro-37!

Sure, I've met him a couple of times at press conferences and the annual
Consumer Electronics Show. Is your point that he has gone into the
magazine publishing to make big bucks in a hurry? I don't know if that is
true but if so, he's an exception. I don't follow his radio magazine(s)
much but the last one I saw didn't seem to be making piles of money.Didn't
he also once publish InCider? That went belly up as I recall (it's been a
while, however).

Scanner Master 6th Edition list AMR in Natick as: AMR SERVICES INC.
NATICK 800 trunked WNWY351. I haven't found the actual trunk yet but
who cares... if its like Newton where AMR also operates they are
dispatched on the Fire freq. and use the Med channels for Hosp to
Ambulance stuff.

Message-ID: <55d65p$83o@newsbf02.news.aol.com>
Source record: 218672

In a message dated 96-11-01 09:14:49 EST, Michael Alexander writes:

<< Perhaps it is that after having written more than a 1000 articles, two books and edited a third, I have a few strong opinions about what makes for objective, quality journalism. >>

I see your point, and I tend to agree. There needs to be more objectivity out there as well as journalists with some sence of moral character. However, it's seems that the radio hobby is such a small niche that finding quality people to write quality articles or books on the radio subject is something that's hard to come by. It is even harder now that the hobby magazines have started to stiff their writers.

Now, here is a challenge: If you feel so strongly about quality journalism why not give Ken Gilbert a call and join his staff as US Scanner News? 1-800-890-6999. It is often easy to be crtical of others when your sitting back in the easy chair, and even easier to critique the quarterback on Monday morning.

2874. Re: Cellular Telephone High Pitch Tone

brpeter@ix.netcom.com wrote:
: Does anyone know what is the purpose (or cause) of the super high pitch
: tone you can hear on a cellular frequency?
Don't know. I've never heard it.

: Also, what is the cause of the cellular phone owner's audio not being
: heard? In some conversations, its quite low in volume, and in others,
: both parties are equal in audio level. But for some you will never
: hear the person with the cellular phone talking at all.
This parts easy to explain.

A cell phone conversation uses two frequencies. One transmitted
from the Cell phone to the Cell Tower, and one transmitted
from the tower to the phone.

Chances are you will be tuned to the frequency transmitted from
the tower, as this is a lot easier to pick up than the phone.

The transmision from the tower is intended to send just the voice
of the person on the land line (not the person on the cell phone).

Usually you can hear the person on the cell phone as well due to
echo effects on the telephone line. When the person on the cell
phone talks. their voice is transmitted back to the tower,
and then onto the telephone lines. Then at some point, usually
at a telephone exchange, some of this is reflected back and so
gets mixed with the voice of the person on the land line. So
the signal transmitted from the tower then contains both voices.

This echo on the telephone line is not an intentional effect,
and serves no deliberate purpose. Although useful to scanner
users. It is just a side efect of the way the telephone system
works. Sometimes it is a strong echo, somtimes weak, and
sometimes non existant.

Therefore the voice of the person on the cell phone will vary in
straength from call to call, but will usually be quieter than
the person on the land line.

Hope that explains at least part of your query.

Richard.

In regards to my reply to Michael Alexander, I only listed US Scanner News because of my affliation with them. However, I urge any of you with the ability to write with some sence of moral objectivity (and accurate frequencies) to give it a try. Monitoring Times, Popular Communications, Popular Electronics are just a few magazines that accept manuscripts for review.

My only advice is that if you are going to include frequencies make sure they are accurate and that if a publisher agrees to publish your work make sure you get an agreement in writing that stipulates your rate of pay.

For what it's worth, I used an Icom version with great results. It
was about 60' above ground level and I used 1/2" hardline as
a feedline, total length was about 80'. The tower was grounded so I
did not try a seperate ground wire. And it was side mounted, just
about 4' away from the tower. Since I moved, I really miss it!

I would replace your RG-58 with at least RG-6, but 9913 or better
would be best. Dont worry about the TV antenna either, its far
out of the way RF wise; vertical seperation is 10x more effective
than the same horizontal distance.

Also, you might have a loss with RF adapters. A good adapter
can insert 1/4 to 1/2 dB loss each, some of the junk ones I
have measured at 3 to 8 dB loss!!! The Icom discone uses a
type "N" connector for good reason. Put the right connector
on the feedline and dont use adapters. Unfortunately, RG-6
has an aluminum shield, so soldering it involves special things.

The cable length should be as short as reasonable, but you wll
never notice a few extra feet with a good cable. Just don't cut
it too short and then have to splice it.

Andy

Most of us know this in our minds... However, we sometimes forget this in our emotions. I can recall a few times when I had to stop myself from getting mad at some guy I never met and say to myself - "it's *just* the net.... It has no bearing on my life." Man, I remember when I was a net-junkie in the late '80s... I *had* to be involved in everything, and had to be online as much as possible during the day... It *really* cut into my reality....

>cellular frequencies I monitor.

It is the SAT (Supervisory Audio Tone) you are hearing. Both the Cell
site and the mobile phone uses this to judge quality of signal. For
instance, if the cell site decides that the tones from your phone are
getting pretty funky, it will tell your phone to change power level,
freqs, etc.

B>Also, what is the cause of the cellular phone owner's audio not being
>heard? In some conversations, its quite low in volume, and in others,
>both parties are equal in audio level. But for some you will never

>cell user's phone). Why does this happen?

Telephones, be they landline or wireless, are duplex devices. It is
very disconcerting to talk and NOT hear yourself through the earpiece.
Your own audio through the earpiece is called sidetone. Some mobile
phones generate their own sidetone, some do not and the cell site will
generate it and retransmit it on the forward channel.

Some phones are capable of a VOX mode for battery savings (ie. only
transmits when user is talking). This mode isn't used much in the U.S.
because of problems associated with it (did the user quit talking or did
he drop out of the system). Also, some phones have differing audio
squelchs and noise cancelling techniques. That may be what you are
hearing.

2880. KS November column

Newsgroup: rec.radio.scanner
Date: 1996-11-01 00:00:00 UTC
From: Andy <andyb@qni.com>
Message-ID: <55da4v$da7@suba01.suba.com>
Source record: 218679

Itï¿½s that time again. Welcome to the Kansas November column. I recently spoke with a couple of the regulars about expanding the scope of the column from its normal content...which is generally public safety. My idea was to include business, Ham radio, aircraft, the Feds, utilities and basically anything else that the scanner might pick up. No one had any great problem with it, so unless someone else has any objections I say "Letï¿½s do it!" Send in what you have and weï¿½ll get it in the column. Those of you that donï¿½t live in the Kansas City area may not be aware of it, but last week we got clobbered with a surprise 8 inch snow. I called it a surprise because the weather forecasters said to expect "no accumulation." Many tree branches had leaves still hanging on for their lives...which gave the snow a choice spot to accumulate...which caused the branches to snap...which caused them to wipe out power lines on the way down. A large percentage of the city was without power, some places for almost a week. The downed lines started lots of fireworks. Metro area fire dispatch centers were terribly busy. The old saying, "Busier than a one armed paper hanger..." kept popping into my head as I monitored them. Equally busy were the utility company radios. KCP&L (Kansas City Power & Light) can be heard locally on the following frequencies. The 451 MHz freqs were the busiest.

153.410 WNJZ899
153.710 WNJZ893
173.300 WNJZ898
173.350 WNJZ898
451.100 WNJZ891
451.375 WNKT249 "Transmission"
451.425 WNJZ898 "F2"
451.525 WNZH900
451.625 WNKT247
854.8875 WNSM966

KCP&L covers most of the metro area, but the Board of Public Utilities runs all the power for Kansas City, Kansas. The BPU used to be in the high band and UHF band, but I think they may have gone to some 800 conventional repeaters. Here is what I have on BPU. Let us know if you can confirm any of the 800 frequencies.

153.605 KAN712
158.160 KAN712
451.025 KUO679 water
451.125 WNJZ845 water
451.200 KAN712
451.475 WNLE275 water
451.575 WNLE275

855.2375
855.3625
855.7125
855.9875

If any of you have listings for utilities in your area, or additions or corrections to this selection, send them in and weï¿½ll get them in the next column. You might include local and county road crews, too. I listen to the snow removal units here in my area, and they give the best road condition reports of all the services on the air. Speaking of road crews, here are the Kansas Department of Transportation frequencies. The 800 freqs are used in the eastern quarter of the state currently, but look for them to spread west soon.

47.180
47.060
47.120
47.200
866.1000 Olathe, Virgil, Blue Rapids
866.1750 Horton, Parker, Sedan
867.2000 Wamego, Waverly, Independence
867.9125 Paola, Severy
868.1750 Bonner Springs, Eskridge, Xenia
868.4000 Lawrence, Buffalo
868.5875 Corning, Emporia, Mineral

Kirk sent an interesting e-mail about the new Family Radio Service. (Kirk, I hope you donï¿½t mind that I included your e-mail message here.) I suspect that people are going to be made aware of the FRS due in part to all the hoopla about it. Some folks in the GMRS are upset because some of the freqs are near/in their band. Others fear it will become like Citizenï¿½s Band radio. Anyway, it might pay to punch these in and see who shows up. Here they are.

1. 462.5625
2. 462.5875
3. 462.6125
4. 462.6375
5. 462.6625
6. 462.6875
7. 462.7125
8. 467.5625
9. 467.5875
10. 467.6125
11. 467.6375
12. 467.6625
13. 467.6875
14. 467.7125

Kirkï¿½s message:

"The FCC Web page contains a search engine for retrieving documents. I found several documents dealing with FRS at their site. The frequencies for FRS are in the GMRS range, some between the frequencies, and some new ones added. There are 16 in total. The allowed power is 1/2 watt.

The petition for this new radio service came from Tandy, and one of their big points was that they wanted to make a new "affordable" radio service, with radios "in the $100 to $150" price range, according to their petition. Likewise they had the backing of the manufacturers like Motorola, Cobra, etc... It is interesting to see that in the '97 catalog, Tandy's first FRS HT (made by Motorola) costs $180 + tax. Not quite the price range they were promoting to the FCC, when they were trying to get this petition granted.

I wonder if the various ham manufacturers could likewise petition the FCC for new frequencies if they wanted to sell more gear. What Tandy did would be akin to Icom telling the FCC they wanted new spectrum so they could sell more affordable radios. Somehow, I doubt this would get past the first secretary at the FCC. It's interesting how Tandy and Motorola were able to pull the puppet strings of the FCC."

Thanks, Kirk.

A friend named John told me that Baldwin City PD (south of Lawrence) is still on 39.220 (Douglas County SO) and 39.980. Traffic on 39.220 is re-broadcast on 155.010. It appears that they have some 800 portables, most likely to talk to Douglas county on their NPSPAC frequencies of 867.3375 and 868.0500. John says there are some dead spots there, so they may be erecting an additional 800 site to provide better coverage. Baker University security in Baldwin City is reported to be using 151.775, Baldwin City local government is on 155.880, and the school bus there is on 151.955.

Gotta go now. Itï¿½s almost 11:00 AM, and I got off the midnight shift at 7:00 this morning. Iï¿½m beat!

Andy

Your contract should also have some exact copyright
stipulations. If you sign away more than "First North
American Publishing" rights, you may be giving away a ton of
royalties. Publishers are recycling material from their
print publications into electronic form and raking in the
big bucks. Usually, the original author doesn't see a penny
from that. Make sure your contract protects your income.

The NF2G Scannist Pages have been heavily revised, expanded and updated as of November 1, 1996. We now cover all 55 of New York's "upstate" counties (outside NYC and Long Island), plus 6 Regions in Ontario Province, Canada. The Canadian coverage extends from the Niagara Falls area around Lake Ontario to Oshawa, including Hamilton, Burlington and Toronto.

Other enhancements include:
-separation of NY-specific from Ontario-specific information
-thematic color schemes to help identify what part of the site you are viewing
-improved feedback form action so you know that your information has actually been sent somewhere

Comments about and corrections to the information presented are always welcome. Please visit soon!

To irratate the hell out of us!

> : Also, what is the cause of the cellular phone owner's audio not being
> : heard? In some conversations, its quite low in volume, and in others,
> : both parties are equal in audio level. But for some you will never
> : hear the person with the cellular phone talking at all.

If you dont here the cell side, they are talking long distance...wierd
eh?
If the cell side is quiet, it could be that the peson is just a quiet
person.
If the other party is quiet then they are both on cell phones and you
are listenng to the one that is louder....scan to see if you can find
the other one....presuming they are in town too.

There are alot of factors.

I just ordered the AOR8000 and the Opto Scout. The guy at the store
told me I don't need to buy a computor interface if I have the scout.
Why not? Does the scout allow you to connect the 8K to my computor?
Finally, if it does will I be able to download band plans to the 8K?
Any info you can give will be appreciated. Thanks!

Please no flames.

2890. Semasoft 32 bit

I just recieved a beta version of the new semasoft 32 bit pocsag decoder that uses your soundcard. Let me tell you guys, this one works 100%!! I highly recommend you support the author Rene Hagen as he has put alot of work into this and desrves to be commended for his efforts! The only bug I have found thus far is when trying to shut the program off it tends to hang semasoft but the other programs that were running at the time were not affected. I have already passed this on to Rene and I am sure he will get the kink out shortly. Now before I start getting hammered with posts and mail, I have no connection with Rene, I just wrote to him asking for the source to first release of semasoft so I could try and get it running. I have made some suggestions to him about the program (ie; trunking data decoding, DTMF etc) so if we support this programmer, maybe we can finally get some decent tools to work with. I do not know when he will release the 32 bit version, but keep your eyes peeled, its coming!!

Tommy Johnson
radioman@texasnetwork.com

PS. Enclosed is the decoded pocsag I recieved on my cheapo pro-2011 with a no name 16 bit soundblaster compatible card in about a 2 minute period.

There is a connector you can use between them. It is called the
SAC-8000 or something like that. It is about $35. OptoElectronics
sells them.

I have one of the Pro 2036 and am really very pleased with it. It doesn't
do cellular and I know of no mods to make it do so other than the freq.
shifter from Grove. I am looking for one of the CTCSS boards...my local RS
can't find one even though I've given them the cat. # from the user's
manual. Could someone possibly help me with this? How much are they, how
hard to install, are they worth the price? Also, have they changed the
Cat.# for these and is there a new one/new order number?
Thanks
Don
PS. I also have the 2037...any goodies for that?

PAtrick,
good points all around. I do let my emotions get the better of me
(sometimes) and perhaps, I should stand off and let sleeping dogs lie.
However, some things just grate on me so much so, that I must respond,
if only to clear my head....

Ah well, so it is.....

Eric.

2895. RF Spectrum Chart

Greetings:

Below is a newly compiled, edited table of the monitorable RF spectrum and its allocations, primarily for the US. This information was derived and compiled from government and other sources. It may be incomplete and/or have errors.

I would appreciate input with respect to correction of typos and other errors, as well as any needed additions or deletions. If you point out an error other than typo, please cite a source of authoritative reference. Input by e-mail is preferred. Thanks.

The sidetone broadcast back to the cell fon on the forward channel is a
much weaker signal. It only has to travel to the tower boundaries, though
from my experience it goes much further depending on conditions that
enhance reception in general.

ESN and MIN are also broadcast on this channel and can be captured clearly
if one is close to the tower, or so I read. If you (or anyone) has tried
this I would like to know of your success (my current scanner doesn't pick
up this freq range).

The TV signal is actually a single 6 MHz wide vestigial
sideband signal. The audio and video information are
subcarriers within this large amplitude modulated envelope.
So are closed captioning, secondary audio, video synch and
all the other information contained in a TV channel.

Ok Sid,

Sorry about the off the subject discussion of the 8000, but this thing is so great, that it is hard not to discuss all the options that it can provide.

I did not know about the improvement in sensitivity. All I know is that I am very happy with mine. It performs better than any scanner I have owned in the past (Radio Shack, and AOR 1500). It out performs and out covers my past scanners. Plus the alpha numeric display helps to keep track of exactly what frequency you are listening too. Having 20 banks of 50 channels is an impovement of the 1500s 10 banks of 100. Only trouble I have found with the 8000 is that there is an image of the cellular band from 1420 to 1440 Mhz.

The computer control scanning has proven to be very helpful. It makes it much easier to reprogram the scanner. I at times travel back home to see my parents, and before I leave I plug the 8000 into the computer and dump the frequencies for back home, into the scanner. Takes all of 5 minutes, what could take hours. When I get back it takes 5 minutes to reprogram the local stuff back in.

I recommend getting a protective case for it. The case and display is very easily scratched. Other than that, I like the way the 8000 looks, and the rubber grips on the side help considerably if you have sweaty hands.

Well that's my 2 cents worth. Hope this helps.

Well I will agree that the receiption below 500 Khz is very poor compared to the rest of the receive range. However, I have talked to several 8000 owners in my area and they all have used theirs to receive several stations and beacon below 500 Khz, so I would say, if you are very close to a Long Wave staton then you 8000 should be able to receive it, otherwise forget it.

Glad to hear that Michael, I thought maybe my AR8000 was the only one
with LW receive on it.

Thanks

Andrew,

A lowfer station is a staton operated under Part 15 rules of the
FCC. They are allocated to the frequency range of 160 to 190 Khz, and
must run at or under 1 watt of input. The antenna length including the
coax must not exceed 50 feet. The station does not require a license from
the FCC. One of the past QSTs had an article about lowfer stations and
you can do a Yahoo! search on the keywords "lowfer" and find infromation
on the net.

Due to the low power and having only a fraction of the necessary length
of antenna, they are harder to hear than other transmitters. Which
makes them a good test on the sensitivity of a receiver.

Thanks and 73
Jory McIntosh

I agree with you about the shortwave reception of the 8000. It was not designed to be a shortwave listening station, and it sure ain't as good a receiver as many of the strictly shortwave receivers avalible on the market. However, I am very surprised at just how well the 8000 receives below 30 Mhz and for that matter below 2 MHz.

Thanks for your comments.

2904. YAESU FTH-2006 modification

Newsgroup: rec.radio.scanner
Date: 1996-11-01 00:00:00 UTC
From: toreh@hekta.iet.hist.no
Message-ID: <toreh.5.000C35B8@hekta.iet.hist.no>
Source record: 218703

A while ago I got a Yeasu FTH-2006 portable VHF transceiver, with 3 preprogrammed channels. Prety useless. A friend told me that there where more buttons under the cover beneath the buttons in the front.
The 4 original buttons were : Lock, Light, Scan and Pri.
I found 4 extra pushbuttons when i removed the tiny steel plate around these buttons. When i pushed one of them i got the current frequency in the display. Another one showed ENC and DEC in the display.

Can anyone tell me what the functions of the 4 buttons are, and how I program new channels into the transceiver.

Hey Everyone,
Lately my 200's battery life has been dwindling between recharges. Lately, it has been down to about 45 minutes. I downloaded some mods from oak.oakland.edu, and noticed that one of them stated that Uniden would do the battery life mod for free, even on an out of warranty unit. Although I have had good luck with Uniden reparing my stuff, I have never had good luck getting them to answer questions. They have never replied to any of my mail (Snail or E-). Do they have a 1-800 number? If so, do they actually answer questions? Any help with this battery life situation would be greatly appreciated.
Thanks....

FOR SALE: Craig (Model 4354) mobile/base station receiver, circa early 1970s. With manual. Has twelve channels covering 3-bands: 33-47 mhz, 152-160 mhz, and 455-465 mhz. It is 'programmable' in that each channel requires (and has) a crystal. I have five additional crystals of different frequencies. With mobile mounting rack and detachable telescopic antenna. Uses 120VAC (50/60Hz), or 13.8VDC. Best Offer. Email:path@awod.com

Tomcat305 who is at mailto:tomcat305@aol.com says...
> Hi, I just got a AR8000 and Some of my freqs. are fuzzy at times so I just
> put that ATT thingy on and it takes it out, but that eliminates the
> distant signals, Is the Fuzzy stuff from the crappy antenna?
It could be several things, but the most common errors are related to
setting mode and step size.
You can hear frequencies with the wrong mode set but they may sound odd.
I.e. mode setting is AM when it should have been NBFM or WBFM when it
should have been NBFM. Using the novice AUTO mode is a common source or
getting the wrong mode setting as the modes change depending on the area
of the world you are in. Some of the built in tables can be wrong for
your area.

Avoid using AUTO. Most public saftey is NBFM, air is AM etc.

The other really common problem is the person who programs a frequency
which the AR8000 scanner appears to take but the wrong step size has been
set for the frequency. There is a restriction in the programming logic
which indicates the step must be a 'factor' or of the given frequency.
Another way of saying that is to say the frequency must be a multiple of
the step. It is easy to program say the VHF fire frequencies which appear
every 15K with a step of 15k when 15k isn't a multiple of those VHF
frequencies. You must use something like 5K. You can prove this is the
problem by moving the memory channel to the second VFO by holding the
enter key down. Then turn the top knob away from the frequency and then
try to turn it back. If the step is wrong for that frequency you will not
be able to get that frequncy back by turning the dial. The CPU can not
tune that frequency using the step you had defaulted to in that case.
That means that though the display had what you had programed the scanner
for it was not receiving that frequeny but something close to it and the
sound will be off.

Be really safe and use a step size of .05K or 50 HZ , that is a factor of
any frequency the scanner will take. This is really important when you
blast a variety of widely different frequencies into the radio using the
computer interface. IMHO it is not worth the effort to calculate the
proper minimum step for those frequencies on a case by case or band by
band basis. I just about set every thing to 50 HZ and forget it.
You can create a simple text file like this
MXA00
MP0 ST000050
MXA01
MP0 ST000050

MXA02
MP0 ST000050
MXA03
MP0 ST000050
MXA04
~ ~ ~ ~ ~ ~ ~ etc....
Write that file to your scanner by sending it to your PC port at 9600 baud with a 200 ms delay between lines. It will set all your memory locations to the samllest step and make them correct for the stored frequency if needed. Use the auto increment function of EXCELL to generate the MX~~~ memory locations with minimum effort. Use the duplicate function of EXCELL to make a 1000 MP0 ST000050 instructions. Merge and use it. Or write a simple script for your favorite communications program to do the same thing using loops etc. Programing the AR8000 is a snap and you can make that chore as easy or as complicated as you desire. Just follow the rules.

Also just before the batteries die in an AR8000 the VHF channels begin to sound 'crappy'. This will occur before the AR8000 decides it is running out of power and displays it's LOW BATTERY warning. Switch to WBFM and listen to a broadcast station for a couple of minutes and kill your nicads off completely so you can later recharge your nicads back to maximum capacity.

I hope one of these above areas help you spot the source of the problem and correct same so you may get on to enjoying your investment in the AR8000.

> Jory McIntosh
> KB5UBS

No, your's isn't the only one. In the first few pages of the ar8000 manual, it states that you can manually input a freq between 100Khz and 500 Khz. I don't have any freqs to test this out on mine but it will accept the input. The crappy ducky that comes with the 8000 doesn't help matters that much either :)

Eric

No, to connect/control the AR8000 by computer (including downloading
band plans), you need the interface. The Scout can reaction tune
the AR8000 and store freq hits it receives in memory.

I plan to have the original Uniden software, along with a Windows front end, available for downloading on my Web site shortly. The cable is merely a 9-pin to 9-pin straight through type. A null modem adapter must be used with this in order to reverse pins 2 & 3.

Give me a few days to get the stuff uploaded...

I think it is a valid argument, though. If you drive a $30,000 four-wheeler, then you should be able to cruise it on the street; if you buy a $5000 computer, you should be able to do simple text-based word processing; and if you buy a $600.00 scanner, you sure as hell should be able to listen to AM radio on the damn thing.

Todd Coles (tcoles@tor.hookup.net) wrote:

: Why would the radio acept a frequency outside the range that it can receive?
: Doesn't really make sense.

Very true. But the following are verifiable facts:

1. The manual states (page 115) that the scanner's coverage starts at
500 kHz.

2. The scanner will accept input frequencies down to 100kHz.

My previous post on the matter was a bit TIC, but one does wonder what is
going on. It seems that the AR8000 is capable of receiving below 500kHz
(contrary to the manufacturer's specifications), but I speculated that its
performance is poor/buggy so AOR decided to start the "official"
coverage at 500kHz.

Anthony D. Proctor (proctor@ix.netcom.com) wrote:

: Is there any way to make the 8K sort the frequencies in the banks.

You can always enter them (manually) in frequency order, or sort them with
an external program.

Thge problem is - how do you know it will make any difference?

I know about the "turbo" modes on various scanners and how they work. The
scan speed is improved because sorted frequencies minimise the changes to the
VFO voltage (that tunes the receiver), and if the scanner knows how long is
required and takes only that long then sorted frequencies scan faster.

However the AR8000 has programmed tuning and squelch-detect times. Wouldn't
that suggest that the AR8000 always waits for the set length of time when
changing frequency, regardless of how long is required? I know that it fails
to scan properly if you set that time too short, so that suggests to me it
waits as long as you tell it to regardless of what the VFO is doing.

My guess is that sorting the channels would have no effect on the AR8000.

Has anyone done any experiments?

Daniel.

Tony, unfortunately our good friends at L.A. County Fire do not have an Internet website or e-mail. Please know that I have been urging them to get on-line for nearly 2 years. Hopefully that will happen soon.

He also wrote...

>I now take a moment to thank you for all of your very insightful and
>helpful posts. LAFD is really on the ball and you are a great
>ambassador for them. It's easy to see that you enjoy what you do!

Gosh Tony <blush>. Thank you for the kind words. I draw tremendous satisfaction from assisting those in the monitoring hobby. A hobby I and many other members of our Department share.

Stay Safe!

Brian Humphrey

dabasap@netcom.com (Greg Griffin) asked:
> is there a comprehensive list of ITINERANT frequencies available?
Don't know about 'comprehensive', but -

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Broadcast Remote Pickup [74.401]
25.87 - 26.45 @ 20/40 kHz intervals
152.87 - 153.35 @ 60 kHz intervals
161.64 - 161.76 @ 30 kHz intervals
450.050 - 450.850 } @ 50/100 kHz
455.050 - 455.850 } intervals

Film and Video Production [90.69]
152.87 152.90 152.93 152.96 152.99 153.02
173.225 173.275 173.325 173.375

Wireless mikes [90.265]
169.445 169.505 170.245 170.305
171.045 171.105 171.845 171.905
plus unused FM/TV broadcast channels [74.802]

Dot Frequencies

Dot color Other
Red 151.625 itinerant "J" Dot 467.7625
Purple 151.955 "K" Dot 467.8125
Blue 154.570 Silver Star 467.850
Green 154.600 Gold Star 467.875
White 462.575 GMRS Red Star 467.900
Black 462.625 GMRS Blue Star 467.925
Orange 462.675 GMRS
Brown 464.500 itinerant
Yellow 464.550 itinerant

"Dot" stickers are used by the manufacturer or distributer to
indicate the frequency of otherwise identical transceivers. They
are often found in rental inventories and on construction sites.
Additional itinerant frequencies include 27.49, 35.04, 43.04,
151.505, 158.400, 469.500 and 469.550 MHz.

I have a opto M1. I love the thing and it works great. Now I am buying additional things for it like antenna's, filters, ect....
I had a Radio Shack one for a few days before I returned it. It doesn't have the good, and valuable, filter and capture features of some of the Opto models. Check out Opto's homepage at www.optoelectronics.com

>Eric.

ERic...don't you think that all this bull about what the Cheeks
Guy is about and how he uses words is rather redundant. what is
this group really about? Or any group. It's a baseless state of
someone's beginning as they want it to be read. That's it.

There is nothing that is real on the internet ... it's read and
forgotten tomorrow.

About the Cheeks guy....did you people ever think that maybe
he is so far ahead of your platitudes-like living that when he
makes statements he knows what your reactions are going to be.

he outdistances most of you because he has the ability to plant
ideas which he knows will get "hot" from the way in which he
lays them out.....if you have nothing else than what he writes
and cannot read between the lines, then you are the one that is
not listening to the Checks guy....

He's using words to get you "up" and "screaming" .... I can do
the same thing. Do it a lot, when it serves a purose. But the
cheeks guy is not answerable to you. If he says he was a member
of Mensa....whether or not he was or is, so what.

In the way in which this group-speak is used, people can be what they damn well infer or state.

That is the state of anarchy existing on this NeT thing...it's a five or ten minute look-see into FICTION.

ERIC....Fiction is smaller than living...it's a fantasy. That is the answer. No one is real. If you get hyped up about that as a major problem in your life, then maybe life is passing you by as a great big "whooosh".....

People .... the NET is a glorified stage of Illusions written by whoever dreams them and read by those who ingest them...the degree to which you get upset is the degree to which you accept the net as more than what it is.... Bill Cheeks knows this.

Don't you get it....he knows it is a fictional stage and can do whatever the fuck he wants to and that is the fact, jack.

If you don't understat this, then the group will continue to be a source of great angst for you....trips to the doctor of the mind to get a grasp on what's real and what is "fiction".....

Think about it eric....Illusions are Creative Fictions.....

What is this? Another word which the IDIOT of Mackey will
get upset about, all over again.

he will NOT get it.... "get" being the verb
"it" being the noun

for those who need edification

he has gone away, but just does not know it yet....
or ever.....

we have a choice....to read what I said in my last post here
about the net as fictional stage of illusions or the reality
which it can never be.....see it.

a nice pair of well formed mammaries just walked into my
bedroom, have to go now......

I believe it rides on the first 17 lines or so of the video carrier. A
poorly aligned TV sometimes shows "noise bars" at the top of the
screen. There is timing, network cueing, and datatext there.

Geeze - it *has* been a long time - I wouldn't trust my memory on exact details, but as I recall it started on OC's red channel and stayed there pretty much until the end (I could hear units on the input from my office on campus). As I recall, LAPD was working in parallel on their freqs once the pursuit dropped off the freeway and it was clear where they were headed. As I recall, LAPD's stuff was divided between WLA and Tac 5. There may have been a little traffic on some of the oddball tacs...

IMHO, the most memorable part was when OC's Control One relayed a message from the CHP asking OC units to drop out of the pursuit [S.O.P. for freeway pursuits] --- The ranking unit in the pursuit [I think it was a sgt from sta 18, the SO] politely replied that the OC units would remain in pursuit, and that the CHP units should drop out [apparently exercising a little-known and seldom used clause in the mutual aid agreement whereby a local agency may refuse CHP assistance at which time the CHP must withdraw].

OC has always had a discipline problem vis-a-vis RED. There is RED coverage for the entire county, and all mobiles monitor RED at all times, in addition to whatever channel the primary is set to. A common prank is to set someone's primary to RED while they're code 7, so that they go 10-8 later for the entire county to hear [and that is usually followed by a chorus of mic scratches, raspberries etc...] The termination of a pursuit is often followed by the same racket... the OJ pursuit was not any different. The pursuit was interrupted once or twice by someone whining 'let OJ go', and when it wound down there was the usual cacophony.

An attempt was made during the pursuit to keep the units appraised of what was apparently going on inside the bronco - but none of that stands out in my mind - I've heard much stranger things 8*(

Right on for getting it to work! FYI, I did NOT have the cable
removed. I did however have it replaced to see if that was the
problem.. It was then sent to Kenwood, and is at their shop now. $200
for the part ALONE. New control board. I had a friend look at it. She
had done work for NASA doing PC Boards. And she said she wouldn't have
touched it. One bajillionth of an inch, and your radio goes bye-bye.
Is opening up the frequnecy REALLY worth the risk?? I know, there's
probably a lot of people who have sucessfully completed the mod, and
just as many who had their radio fried. I unfortunately am one of the
latter.

UHP uses many frequencies, depends upon which district or area you are interested in. You may want to pick up a copy of "Monitor America", 3rd edition. Has a lot of detail on UHP in it.

Andrew,

Check out my review of the AR1500 at
http://www.designeq.com/AR1500review.html. This should answer your basic
questions. I wouldn't pay more than $200 for an AR1500.

Thr current version only supports 512 bps. The transmissions in the Netherlands are 512 bps. But it probably wouldnt be to difficult to add 1200, 2400 bps support. Sent me a sample recording of a 1200 or 2400 bps transmission and I will check it out. (.wav file, sample rate 11.025 Hz, 8 bits, mono, sent the first 5 to 10 seconds of a transmission).

2955. Cell Phones Unwanted in Wilderness

Newsgroup: rec.radio.scanner
Date: 1996-11-02 00:00:00 UTC
From: rfws@aol.com
Message-ID: <55ftha$7mp@newsbf02.news.aol.com>
Source record: 218599

BOULDER, Colorado, Oct. 24 (RFWS News). A group calling itself The Radio Free Wilderness Society announced plans to stop the use of portable cellular telephones in the backcountry. The group plans to take several actions including lobbying Congress to ban the use of "inappropriate communication devices" (including cellular telephones) in national parks, national forests and wilderness areas. This action is in response to the increased use of portable telephones in remote wilderness areas.

A spokesperson for the society said "Cellular telephones are ruining the backcountry experience for millions of outdoor enthusiasts. On a summer day, it is very common to find multiple people making phone calls from the most popular mountain summits. Worse yet, this new technology creates a false sense of security on the part of inexperienced people in the backcountry. One hiker I encountered in the backcountry did not have proper clothing because he thought his cellphone was sufficient insurance in case of bad weather. The park rangers aren't saying too much about it but it is getting to be a real problem for them. People get into a tough spot and expect a phone call to result in instant aid."

In addition to pushing Congress for portable phone restrictions on federal land, the society has proposed the installation of jamming devices that would prevent the use of cellular phones in certain wilderness areas. Such jamming devices would be a violation of Federal Communications Commission regulations. The society spokesperson said that they would only install the devices near designated wilderness areas and national parks and the devices would affect cellular telephone frequencies only. Two-way radios used by national park, national forest and law enforcement authorities would not be affected.

This is amazing!

[[[[DELURKING]]]]

Here's a firefight that reminds me of Quang Tri Province (and considering the average age of a 'scannist,' many of you know where that @(#^@*&!! place is).

There's no need to argue about Cheek --- the history is clear. He is probably the most egotistical scanner guru around, and that statement/judgement should satisfy his critics. However, I don't know anyone more knowledgeable, so in my view most of that ego is earned.
^^^^^^^^^^^^

The facts are simple: in my view, he's done more to enhance scanner performance, for more people, for longer, than anyone else.

If you people would just recognize that (1) Cheek's got a big head, and (2) he's pretty damn good, this little battle might subside.

Just two cents from a competing semi-guru, who goes to Bill to check facts.

Henry Eisenson

Thanks for the info Jory. I was aware of an allocation in, I believe,
New Zealand, and possibly Australia, in this range - I believe about
100W RF into any antenna is allowed - but hadn't heard of a US
allocation. Over here we've just been allocated a small area around
73KHz - 1 watt ERP but I'd love to see someone measure it :-) and I'll
be interested to see what happens there.

BTW I use a Yupi 7100 and am quite pleased with it. A fair few more
sprogs than I'd have preferred but not bad withal. Needs a fair bit of
wire to get any results on long wave though. I'll be looking for a
dedicated LF Rx soon. Preferably all-valve. Perhaps even TRF. I suppose
if I flick the tuning up and down regularly you could call that a

scanner :-)

TRY THE VALOR "GLASS MASTER" MODEL TGS (THRU THE GLASS) SCANNER ANTENNA.
IT RESEMBLES A CELLULAR PHONE ANTENNA, AND THEY ARE VERY REASONABLY
PRICED AND EASY TO INSTALL.
WE INSTALLED THEM ON A FLEET OF "CKY TV NEWS HOUR" VANS A FEW MONTHS
AGO,(HERE IN WINNIPEG, MANITOBA) AND THE REPORTERS REALLY LIKE THEM.
THEY TOO ARE USING HAND-HELD SCANNERS.

Standard rubber duckies are good for one purpose only - picking up strong/close locations. An extended whip is better. I've had a lot of luck with an Austin Condor high gain whip. It's about 12 inches long and 3/4 inch diameter so it looks a little funny but it works really well over a large frequency range. 5 miles from the tower shouldn't be too difficult to get the tower. One other solution is one of those extended wire antennas that go in the attic or other out of the way place. They aren't as good as an external but (like virtually anything) are better than a duck.

Happy scanning

This is good advice, unfortunately, not many publishers do see it that way. Few newspapers and magazines have clearly spelled out policies to reimburse freelancers for their work if it is used electronically, on web sites and so on. In my experience, you have to raise the subject with every editor you deal with before accepting the assignment or otherwise there is a presumption that what they're buying is theirs to do with as they want. And then, some won't give you the assignment because of it.

For those who don't know, North American serial rights give them the right to use your material in a magazine or newspaper once in North America. It was fairly standard practice before electronic publishing really took off.

2973. Houston, TX Frequencies List Wanted

Newsgroup: rec.radio.scanner
Date: 1996-11-02 00:00:00 UTC
From: Dub McNamara <dub.mc@worldnet.att.net>
Message-ID: <327BDC0B.402@worldnet.att.net>
Source record: 218617

Does anyone have a list of frequencies in Houston, TX. If so I would very much appreciate your e-mailing them to me or posting them on this newgroup.

Thanks.

dub.mc@worldnet.att.net

Radio Free Wilderness, huh? My brother-in-law would probably like to join
that group. We were in a market one day when he spied some lady pushing
her shopping cart and talking on her cellular phone. He was outraged! I
couldn't believe his anger! He said, "That's the stupidest thing I have
ever seen. I hate those cell phones!" I told him that maybe it looked
stupid to him, and maybe it looked stupid to me, but how was that lady
harming anyone? He didn't like that answer.

I hope these wilderness jerks didn't drive their cars to the spot where
they began their self-righteous hike.

Hmmmm. Wonder if they packed Charmin?

So you jam up the phones and let them die?! Why not use the money to
put up signs, or buy advertisements in the media to teach hikers instead
of jamming the frequencies? Do you really think that hiker mentioned
above would've refrained from going on his trip if he didn't have the
phone? No, he probably would've done the exact same thing and brought a
cheap Wal-Mart CB instead with the same expectations.

Environmentalists gone wild. Jamming devices for cellphones in the
woods? I'd like to know what AT&T, McCaw, and other cell providers have
to say about that. Good luck lobbying Congress. The executive branch
may get Algore again but Congress will be solidly Republican ensuring
fringe groups stay on the fringe.

Well make sure you use the LINE input on your new soundcard. Also, make sure you choose LINE as the recording source. If it's set to anything else, you won't get squat, except another blown card. Double click on the speaker symbol in Win95 to get to the Volume Settings, then OPTIONS, PROPERTIES, RECORDING.

Nope. The TV channel is a contiguous envelope. The WFM
audio signal (along with all of the other "carriers") is a
subcarrier within the channel.

>
> Brian Petersen
> brpeter@ix.netcom.com

The high pitch tone is something I've not stopped to look at, but the
reason that you sometimes only hear one person and sometimes both (at
varying levels of volume) is that cellphones use two transmit/receive
frequencies, one for the cell to the handset and one for the handset to
the cell, and in the same way you can hear yourself talk on a normal
telephone call, on a cellphone call there is a certain amount of audio
feedback into the cell's transmission to the handset, which varies with
how far away the handset is to the cell antenna, etc.
You would usually tune into the local cell, which carries much more
power and is more easily heard than the handset which delivers between 1
and 10 watts, thus always picking up the land-based speaker rather than
the handset owner. You could hear the owner as easily if you were near
his handset and tuned into his transmit frequency.

Anybody hear of this?

My daughter saw an ad on TV for a device that looked like a cellular phone but appeared to work like a two-way radio. It appeared in the ad (she had it on tape and showed it to me) that several people in an area could hear whatever one person would say on the handheld transcievers. They said things like "no phone bills" and so forth. It looked like a mini-walkie-talkie of some sort. Anybody seen these, or even the ads? - Dave

would like to trade a very nice PRO-62 hand held scanner for any one of
the following in equally very nice shape: PRO-51; PRO-43; PRO-39; PRO-2004.
(or what have you in those lines?)
The PRO-62 is 200 channels and tripple conversion. It is cell blocked and
from what I understand, there is not a quick remedy to that except for the
use of a converter. I have a converter which is not part of this offer, but
could be worked in if what is offered by you in trade would dictate that.
If interested, Please e-mail me.

As a scanner -- yes, As a Communications Receiver -- very good Receiver
I would give the $9.50.

It all depends what you want to do with it. Most scanners today I
suspect will do what you want to do with it. Yes, the Comm Receivers are
a different kind of machine.

Source record: 218529

With the opening of the second east-west runway, the ground and takeoff/landing control frequencies have been split into north and south control areas. The frequencies are as follows:

Tower South - runway 08R/26L 118.70 MHz
Tower North - runway 08L/26R 119.55 MHz (New runway)
Tower 226.50 MHz
Ground South 121.70 MHz
Ground North 127.15 MHz
Ground 275.80 MHz

Some Additional Frequencies:
ATIS 124.60 MHz
Departure 120.50 MHz
Arrival 124.00 MHz
Clearance Delivery 121.40 MHz

The lengths of the runways are 11,000 feet for the original runway (08R/26L) runway and 9,940 feet for the new runway (08L/26R).

The first planned landing on the new runway is scheduled for 0930 PST Monday, November 4, 1996 and the plane will be a Boeing 777.

The plan for the first six months is to use the new runway for all landings and the original runway for all takeoffs.

Someone asked if USSS E/F was still working and it appears so. I caught a conversation between Hillary (On board Exec 1 Fox) making an appointment for a pedicure and manicure. The whole conversation lasted maybe 5 minutes and also took about 5 minutes for the comm guys to get everything set. Only caught traffic on the downlink (415.7). They talked to Crown 13. Time was approx 13:15 Pacific and she had just taken off from Corvallis, Or (CVO). Didn't catch a tail number but it was a DC-9 painted up in the typical United States of America scheme.

Also caught the following codenames during her visit here.

TRADEMARK
TOMCHAT (SP?)
SPRINKLE
WINDOW

Any one have the master list of code names? Trademark was most likely the First Lady's motorcade.

What's the going rate these days for a GMRS license? It used to be $35,
but I'm sure it's gone up by now...also, how long is the license good for?
5 years?

I am looking for the 10 codes that are used in North Arlington, NJ. I already looked in the new Scanner Master 6th edition and in the 1997 edition of Police Call.

If there is someone who is or is not from North Arlington, NJ that has the 10 codes for the town, please post them. Thanks.

Message-ID: <55i9iv$c8pi@news.goodnet.com>
Source record: 218540

try searching the 225-400 area for ATC and dispatch communications
148-150 and 162-171 will give you some ground operationsie fire/maint
frequencies...you may also get some paging and operations activity in the
406-420mhz area....also lets not forget the 118-136 ATC band!
you can usually find an ATIS frequency..once you find this, it will tell
you other frequencies in use!

tyler (tyler@cyberia.com) wrote:

>: Should this monitoring opportunity be as illegal as phone monitoring?

1. Is it ethical? I don't know, by whose definition shall we go?

2. Should it be illegal? This is something I hear a lot of discussion about with a lot of varying views. Most all of which are a lot of wasted words. Simply put, a law which is unenforceable is a BAD LAW. We already have too many of these on the books in the United States. Fine if congress wants a law prohibiting manufacturers from making and selling scanning equipment from receiving certain frequencies. But to carry that further and attempt to control what direction a hobbyist takes in his thinking and tinkering as concerns a passive reception device is absurd. People who write such laws are absurd and are wasting public time and money. Find a better use for your time, catch those people actively engaging in acts which physically hurt others. You know... theft, burglary, credit card ripoff, etc.

3. If it is broadcast...it will be received.

4. As an old retired Navy man I will tell you this, when we wanted absolutely NO ONE to intercept a broadcast, we didn't broadcast. SIMPLE.

Bob

Hallo belangstellenden,

Mijn naam is Jan, ik beheer de Scanner Homepage Nederland op URL

http://www.pi.net/~jvduin/home.html

Wegens het grote succes van mijn pagina's ben ik door Planet Internet
afgesloten!!! Mijn pagina's genereren teveel dataverkeer, dus draait
PI de kraan dicht.

Nu is er een eenvoudige oplossing, ik ga zelf een domeinnaam aanvragen
en daar de pagina's publiceren. Hiermee worden mijn mogelijkheden ook
erg uitgebreid!

Hier heb ik SPONSORS voor nodig. Ik lever u de lezers voor uw wervende
teksten/links enzovoorts, alles is mogelijk. Ik heb ook een
uitgebreide ledenlijst voor mijn Scanner Mailinglist, allemaal scanner
fanaten! (Mailinglist leden hoeven niet ongerust te zijn, uw email
adres zal niet "uitgeleverd worden!)

Bent u commercieel verbonden aan het fenomeen "scanner"? Dan kunnen
wij samenwerken!

Stuur mij een email als u geinteresseerd bent.

I have a question:
I would like to get a 1v p-p a.c. signal (audio chain output) for recording purposes. I have the following model of scanner:
RS PRO-2022 programmable...

Also, I would like to increase squelch sensitivity (decrease time lag between signal detect and actual audio output).

And good suggestions would be appreciated.

3016. Re: Question about repeaters

Newsgroup: rec.radio.scanner
Date: 1996-11-03 00:00:00 UTC
From: jbhardy@wtaccess.com
Message-ID: <565fhe$qj71@news.iglobal.net>
Source record: 218546

The sound that you hear on the repeater after someone stops transmitting is known as the "repeater tail." The repeater owner can control the duration of the tail on most repeaters. The beeps that you hear can be several things. The most common is the "courtesy beep" that tells the next party that the repeater has reset and is ready to be used again. If you are listening to amateur radio repeaters, the beeps that you hear are morse code identifiers that the FCC requires every ten minutes for station identification.

Hope this helps,

Jim

3019. Q: Scanner future ?

Newsgroup: rec.radio.scanner
Date: 1996-11-03 00:00:00 UTC
From: swl@post3.tele.dk
Message-ID: <327dec24.4901631@news.inet.tele.dk>
Source record: 218633

I'm relatively new to this group (and others :-)). Recently I took up scanning out of pure interest in what that world was like. And now I find that it's a really great hobby. I't has gotten me away from the "to many and to late hours " in front of my computer (I might possibly be a computernerd - and proud of that to). But In a little new family I find that scanning actually fits the bill nicely.
Spend the best part of 10 years with a mean of 5 hours a day in front of my computer :-) i now feel very happy with this "tech" stuff.

I have two major Q's and if anyone would like to give me their view I would be very happy.

1:) My local Police Department have just almost entirely switched to digital - as far as i know from the drop in trafic. Maybe (and almost for sure) the future is Digital. Where will the scanning be in, say 10 years ? Are there already a premature death to my newfound hobby ?

2:) I use a UBC3000xlt (an extremely good apparatus) but i would like to buy either a sw reciewer OR a AOR8000 [to extend the amount of buttons i command :-)] to compliment in some way my listening. I might be inclined to get the 8K with a scout. But iI would like to hear from somebody with a working combo in any of the abovementioned gear.

Sorry if this letter is too long.

BTW. These groups are my favorites and a few of the regulars are in higt regard's here on my little place in Denmark
Regards to Dr. Pepper.

Just imagine the liability... Imagine this scenario... Two days hike from the nearest trail head, Joe Cellphone Backpacker gets attacked by a bear... (or submit your favorite emergency here...) He gets on his cellphone to call for help... But guess what!?!?! The damn frequency is JAMMED!! US Forest Service and environmentalist group gets sued by Joe C. Backpacker's family because he died while his friends were hiking to the trail head to get help....

You may want to try to search on the WEB. There are several folks who
post frequencies. Try going to Yahoo, then to Entertainment, then to
Amateur Radio and there should be something there.

The old CompuScan 2100 was designed to run with a Commodore 64
using an RS-232 port.

It was furnished with the receiver, cables, and software, and
had a 200 channel capacity.

For a complete review, see "CompuScan/2100 Bearcat Scanning
Receiver," by Joe Desposito, in Jan. 1984 Computers & Electronics
magazine.

I seriously doubt it, besides Al Cowlings *called* the cops.

I listened to the chase, not only on the CHP frequency, but on the Media frequencies as well which was a lot more interesting than "Northbound at Imperial<beep>......Northbound at Manchester, 40 mph number 1 lane <beep>...." However, the CHP and LAPD were going to Rockingham well ahead of the chase, I remember LAPD telling units to go there, and also to not get involved in the chase.

But the media frequencies were great, all the live trucks trying to get to overpases to shoot the chase, the 7 or so media helicopters flying overhead, crews being sent to Rockingham and Bundy, actually the whole day was fun to listen to, especially when everyone descended on Bundy in the early afternoon, almost every media outlet figured they were going to find OJ's body in the condo.

The best part of the thing though was when OJ didn't show up like he was supposed to in the morning, they put out an APB for him, and I actually heard it on both CHP and LAPD "All units, Officer Saftey Broadcast, 187 suspect at large, Orenthal James Simpson, Black Male, 6'2", 240 pounds, possible armed and dangerous, all information LAPD central division."

3032. FS: AOR AR1000 unblocked - $275 firm

Newsgroup: rec.radio.scanner
Date: 1996-11-03 00:00:00 UTC
From: douglas@netcom.com
Message-ID: <douglasE0B9AF.76I@netcom.com>
Source record: 218646
Cross-posted to: rec.radio.scanner,rec.radio.swap,alt.radio.scanner

For Sale: AOR AR1000XLT Handheld Scanner - $275 including shipping, COD

- Like New (and I *know* what "Like New" means!)

- Full wide-range receiver (500KHz - 1300Mhz)

- 1000 Memories, 10 Search Banks

- Unblocked cellular

- In original box with:
Wall adapter
Car adapter
Rubber duckie (full range)
Belt clip
Carry strap
Owner's manual

- Also included:
Howard Bornstein's "Guide to the AR1000" book
Leather case with keyboard cover
NiCad AA's
Panasonic AA wall charger

This unit has never left my house, it was only used for listening to the local action. It's a fantastic unit, great in every way. The only reason I'm passing it on is due to the recent purchase of an AR8000!

If someone wants a full-range unblocked scanner that looks brand new, this is a great unit at a very good price (check the net!). The included book takes all the mystery out of programming, great for beginners.

Sorry, no trades at this time, I had to pull the kids out of college to pay for the AR8000! (smile).

Actually you may not have caught it, but LA Times mentioned that the police
had worked with Cellular One (or was it GTE?) and not only heard his cell
conversations but transcribed them. Of course it wasn't admissable for
whatever reason but amusingly enough in some exerpts when he was talking
to his mom he says "I DID IT MOM!" while sobbing.

Big suprise, huh?

I was shocked at how easily he cell company worked with the cops and was
suprised that the paper didn't make more out of it.

For the most part, most of us aren't really interested in listening -
just being capable of it. It is really a subtle form of civil
disobedience - disobeying a stupid, largely unenforceable law which gives
cell phone dealers the opportunity to "guarantee" privacy, rather than
having to admit to the customer that their phones are unsecure (and risk
losing a sale). Believe me, if they never passed that moronic law, it
would not be an issue. And the majority of us would still not listen in....

My area of the California High Desert is rich in RF "stuff". We get a lot of stuff from San Bernardino County, Kern and etc. and even Death Valley.

I just heard something new. Can someone tell me what they think it is? On 140.9500, the following conversation (one side only) heard on Sunday, at about Noon. PST

"Dragnet one and all other responding agencies, be advised, you should wear your green apron, , , Be advised, wear the green apron"

Just prior to this, the same voice was "calling all units", on the same freq.

Now, the 140 mHz is the gumamint. But WHO?? They evidently had something BiiG going down.

>In addition to pushing Congress for portable phone restrictions on federal
>land, the society has proposed the installation of jamming devices that

This is so insane. I too think it makes people look like idiots, I've even seen people riding bicycles using them. However, I'll look at a million idiots using them if it saves one person who gets into a bad spot in the woods.

The logic sounds like the anti-gun groups: Make guns against the law so the proverbial "bad guys" don't have them. Even as a non-gun-owner myself, I know that logic like that is asnine. I've never feared legal gun owners, bad guys are going to have them regardless -- let them wonder if the next house they break into is going to have someone with heat!

If this Environmental group wanted the one-in-a-million chance at doing something about it they should have changed the marketing: Instead of all this blocking crap, install park-owned cell towers located in key locations that cover the A and B channels so that any call you make will just get routed to the Park Rangers or 911. Emergencies get through and Aunt Marge is just gonna have to wait until later to hear about how much fun you and the kids and having. Put up a few signs explaining to people how cell phone calls are routed for emergency calls only.

I can see some benefits of allowing cell use in the really wild areas - most people aren't gonna plunk down the money for a used-once-a-year handheld radio, CB is big and dated and often useless. Cell is cheap, portable, multi-use.

Just turn the thing off when not in use, if I heard one more ring during a movie at the theater, they will feel the wrath of my Large Diet Coke and Huge Popcorn coming down.

This group would better off posting some signs about how cell phones should be for "emergency use only" for the enjoyment of everyone outdoors. People are still going to use them but it may notify a few of the cluless that it isn't always appropriate.

>I was wondering if anyone with the AR2700 found that
>it was not sensitive enough to pick up weaker signals
>when scanning the preprogrammed channels? ....

I found the insensitive squelch was a serious problem with the
particular AOR AR2700 I tested for Monitoring Times and
pointed it out in a 10/95 MT review.

Also, from the "Buying a Used Scanner FAQ:"

AR2700: 1995 vintage. 500 channel portable covering 500 kHz
to 1300 MHz. Lots of good features, e.g., 10 linkable
search banks, lighted keypad, per-channel attenuator, S-
meter, battery meter, optional voice recorder and speech
inversion descrambler. Global rescan and pause delays, but
no auto store, data skip, nor battery saver. Internally
generated noise results in broad birdies on AR2700 tested.
Insensitive carrier operated (vs. noise operated) squelch
stays closed on signals unless they are moderately strong,
causing scanner to skip transmissions of interest. IFs are
287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700
Portable Scanner," by Bob Parnass, AJ9S, in Monitoring
Times, October and November 1995.

I was told that I could wrap one end of just a plain 10 ft. long wire around my $10 scanner antenna, and the other end of the regular wire around a bolt anywhere along my tv antenna cable coming down from the attic. There are bolts on the cable right when the cable comes out of the wall. If I wrap the other end of this regular wire around the bolt, will it improve my reception? Won't the tv antenna help me out greatly?

Also, I was told that the small hole section of a wall outlet is just a ground, and it too could be used as an antenna (if you put the end of the wire in the hole section of the outlet). Does anyone know anything about this? I don't want to burn anything down or blow anything up.
Thanks in advance.

This mod is a new mod as of 11/3/96

YAESU FT-50R Expanded Transmit 120-230, 315-505 MHz [FREEBAND MODIFICATION]

1. Remove battery
2. Remove the Ni-Cd sticker
3. Slowly lift off the keypad and carefully locate the jumper pads
4. Locate and unsolder jumper number "1" (see picture below) it is a solder blob between 2 pads.
5. Locate and unsolder surface mount resistor "A" (see picture below) be careful! It is the first resistor on the from left
6. Reinstall the keypad with the two screws
7. Turn radio off
8. Press down and hold the tuning knob and lamp button while turning on the radio.

VIEW: looking down with keypad removed

```

10. The vfo should display 144.000 Press FW. (this step may not be needed but it worked for me)

Power off.

11. Powerup with lamp/ptt/knob held down. It should now be in tune mode with something new (BAND= A 1) change it pressing the knob for 1/2 second and then turn the knob to FREE. (BAND=FREE)
12. Power off and back on NOW RADIO DISPLAYS 50~540 590~1000 no gaps!!!

(Dont change any other function or you could screw up alot of adjustments here)

IT will tx where ever it locks. One radio 122~231 and 309~502 and another radio was 120-232mhz and 315-509mhz. This varies radio by radio.

Tx is only miliwatts near the edges (DONT TX OUT OF BAND!!!).
Rx locks after about 74mhz. it is very deaf in the 220 band tx is miliwatts. no tx above 502
but varies radio by radio.

13. If you have the ADMS 1 software you should have a copy of what was in your radio.before you
started.
14. Copy from the radio. Save and name this file FREEBAND. This is to be saved as a clean copy for
future use.
15. Copy from the radio again (or just copy the file) name this file MERGE.
16. Merge the old file to this file and send to radio.
17. With your palms facing forward put your thumbs in your ears, wiggle your fingers and stick
out your tongue at your Users manual while it is open to page 10.
18. Then update page 10.

Dont make the FCC and Yaesu angry at you by transmitting where you are not supposed to.

This information came from a Newsgroup message by Alan Judd, information gained from the Web Page at
http://members.gnn.com/hca/ft50/index.htm and my own attempts at restoring the radio using this
FREEBAND Mod.
Please give Alan Judd great thanks for subjecting his radio to T&E R&D (trial and error research and
development).

I'd be interested in a copy of this to try on a P-120 Laptop.. For the
HP, if you can/have a config.sys file, type EDIT C:\CONFIG.SYS, and
change the STACKS= line in there. Increase it, my guess would be to
STACKS=4,200
Let me know if this works..

In article <55j4ua$55c@newsfep1.sprintmail.com>,
mkirschenman@sprintmail.com says...
> I am currently thinking of buying a AR3000A. If any of you have
> experience or knowledge of these units any information you could
> provide (the good as well as the bad) would be a great help.
>
> mike
>
> mkirschenman@sprintmail.com

I've had an AR3000A for about 5 years, has been quite good. Here
is a review I did a few years ago...

From 1991: This is an evaluation of the AOR AR-3000A. I have owned the
unit for two years now.
The unit is pretty solid. It has a plastic case but it has held up
quite well. I have traveled with it to many locations. I have never
dropped it though. I did wear out the BNC connector on the back of
the unit. I replaced it myself - no problem. Easy solder job. The only
mod (not really mod) I have made is to change the serial port bps rate
from 4800 to 9600. That is done by flipping one of the internal switches.
ACE seems to still advertise the AR3000. I don't think it has been
offered for the past 1.5 years! These are the major differences between
the AR3000 and AR3000A:
1. The 6 LEDs to the left of the LCD panel have been integrated
into the LCD
2. There are two additonal buttons to the right of the LCD, one
speeds up the scan rate of the manual tuning knob, and the
other one multiplies the current step rate by 10.
3. The RS232 com port has additonal commands (but I don't know what
they are yet as ACE (the distributer in the US) hasn't released
the new manual yet! I asked about a half dozen times and finally
gave up. Anyone that has a list of what you can do, I would
appreciate posting them!
The unit is quite expensive and the prices seems to have gone up
in the past two years, probably due to the falling US dollar. I wanted
something that could receive just about everything, that I could
connect to my computer and something that was portable. The [ACE] ad was
bit misleading, because it lists a adapter/charger as standard, but the
unit DOES NOT run on batteries. I did not purchase through ACE as their
price was as high as it could go [suggested list price].
The unit comes standard with a whip, which is useless below about
5MHz.
I bought at 56" whip and a 800MHz whip that work better. The unit
locked up twice on me the first week I had it, but hasn't done it

since (and that was two years ago). Of course all programming is done
via the serial port.
Performace. I don't have another scanner to compare the AR3000A to,
but I can compare it to my SuperRadio, "typical" TVs, Sangean ATS-808.
I will say this right off the bat: The 6kHz
filter that is used for AM and NFM is terrible. I would upgrade this
filter except that places like EEB want over $300 for it. Plus I'm
not sure if it would be good for NFM. Both modes use the same filter
and you can't change that.
LW/MW: Performance is terrible. I have tried long wires,
short wires, and even a homemade loop. I didn't expect it to perform
that well. But my ATS-808 can beat it hands tied behind its back!
The ATS-808 is ok for MW, but the Superradio is hands down the winner
by about 10x!
SW: Sensitivity improves around 7MhZ. Below that, not very
good. For instance I can not get WWV on 2.5 Mhz, but it comes in
fair on the ATS-808. LSB/USB works well.
VHF/UHF: Sensitivity is good. Selectivity in WFM mode is poor. Very
prone to overload on the FM broadcast band. In NFM things are better, but
I think the replacement filter would be a big help. When tuning a Ham
repeater, for instance, it is very difficult to determine the exact
frequency, even though the AR3000A tunes down to 500Hz steps!

But, overall, I am happy with the unit. Even today, there is not
much else in the size/coverage/price.

>it could be.

Careful with them; you probably don't have a license to transmit there,
and you need a Tech or higher license for the Ramsey crap.

If the Xandi one is like the Ramsey FM-6, be very careful. It has *NO*
output filtering, and puts out spurs all over the place (every 12 MHz up
and down from the carrier and its harmonics) - assembled according to
their instructions, it is ILLEGAL to use, even with the appropriate
license.

(Note. I haven't seen the Xandi other than in their ads. When I called
and asked whether they made them on frequencies that hams are allowed to
transmit on, they trotted out the old "anyone can transmit anywhere under
100 mW" story that Nick Goss used to use. That was the old rule for the
FM broadcast band; it's now based in field strength at a certain distance
from the antenna.)

If you do have a ham license, and a *valid* use for the transmitter (no,
bugging a room won't do), look at Agrelo Engineering's transmitters. They
are great for telemetry, APRS, foxes, etc. All they need is a battery and
an ID'er (he sells voice IDers for foxes also), and they are well made,
and meet the FCC's emissions specs.

Message-ID: <327EBE96.2232@worldnet.att.net>
Source record: 218417

The El light is glued by at least one end of its strip to the display. The EL slides underneath the display piece, snuggly.

It can be removed, gently, I've used a razor to break the bond/glue at one end of the strip, then gently pull the EL strip out.

Problem is, they no longer stock the part. Unless someone knows of a source for the EL, you're now out of luck.

You might want to try using LEDs behind the display. Someone will eventually post a solution to the problem, hopefully. I've illuminated my PRO-43's screen with LEDs which now make it look like the display on a 200XLT or 2035, same yellow/green color but haven't experimented with the 2004 yet. Good luck.

(If you're that desperate for a fix, you might try ordering the entire display board, but it's gonna cost $$$)

Regards,
LGS

Actually, closed captioning is in the Vertical Interval of the video, along with other data, Time Code, videotext, network messages. As stated, the 6mHz tv signal you recieve is made up of many subcarriers. The video is AM and has sidebands for color, sound is FM and is mixed into the entire 6mHz envelope, it also has a pilot subcarrier for stereo where applicable.

I've had a lot of
>luck with an Austin Condor high gain whip. It's about 12 inches long
>and 3/4 inch diameter

I put together a Ramsey aircraft monitor radio a while ago and they said the ideal length for a whip would be about 21 inches for the aircraft band although any whip of any sort would be better than a rubber ducky.

5 miles from the tower shouldn't be too difficult to get the tower.

No, it shouldn't. Unless there is a large hill blocking your line of sight from the airport, you should be able to get it easily. You could even try a mobile scanning antenna in your attic. I have an old mag mount cellular antenna in my attic right now to listen to cell phones on. I stuck it on top of an old computer case so it had some ground plane to grab on to. You could either do this, or stick it to the top of a fridge if you have the roof space above the fridge to allow the antenna to stick up completely. It's not ideal, but it will do better than your rubber ducky. I have no antenna regulations here even though we rent. My landlord says I could put up an antenna on the tower that is beside the house. (I got lucky when my wife found the house) EXCEPT, the tower is not bolted to the house in any way. At the top, I get too damn scared that the tower is going to fall away as I go over the roof line so I haven't put anything outside. (I'm about 230 lbs) Nice situation huh? I think I have it solved. I recently stopped at a truck stop and picked up two nylon tie down things that truckers use to hold the loads down. I'm going to attach those to the tower through the attic windows (there are two) and around the chimney inside the attic. This will be ok if I don't pull the whole damn house down with me.

To all the politically-correct "thought police" types who have chosen to comment on my use of the term "black animals"...

What do YOU call "people" who riot, loot, burn, pillage, and intentionally destroy the property of others? Especially when they target the property of other racial groups (whites and Asians) and leave intact the property of their own race (blacks)

I call them "ANIMALS"

Since the race of the perpetrators involved in this particular incident happens to be 100% BLACK (Oh, I'm sorry..."African-American" for all you pointy-head PC-types), I would suggest that "BLACK ANIMALS" is therefore a very accurately-descriptive term.

To all the politically-correct "thought police" types who have chosen to comment on my use of the term "black animals"...

What do YOU call "people" who riot, loot, burn, pillage, and intentionally destroy the property of others? Especially when they target the property of other racial groups (whites and Asians) and leave intact the property of their own race (blacks)

I call them "ANIMALS"

Since the race of the perpetrators involved in this particular incident happens to be 100% BLACK (Oh, I'm sorry..."African-American" for all you pointy-head PC-types), I would suggest that "BLACK ANIMALS" is therefore a very accurately-descriptive term.

David,

I bought a RS(Made by GRE) scanner preamp for about $65.00. It is pretty nice.
It's small but is pretty effective. Makes distant noisy channels clear.
I suggest it. I knew I was not returning tTHIS RS product whenever I turned
the dial from min->max and watched the strength of the signal on my radio go
from 1 to 2 to 7 or 9.

I have found the null modem adapter is required if you use the
standard DB-9 to DB-9 cable (typical cable required for todays PCs). You
MUST ensure pins 2 & 3 are exchanged for proper communication between
computer and MR-8100. Some cables may already have these pins reversed;
thus the confusion. Older computers which have the DB-25 serial
connector may not need the null modem (mine didn't).

The MR-8100 was not a well known model, however that's no excuse for
fabricating such conjectures! Obviously, you should find another dealer.

I recently checked with Uniden and they no longer have power connectors
for the MR-8100. In fact, they have very few parts left at all for it.
If anyone needs parts for this scanner, they ought to call Uniden now.
Their number is 800-297-1023 / 817-858-3300 (Ft. Worth, TX).

By the way, in one of my earlier posts, I misidentified my Web page,
which will soon contain the Windows programming software for the MR-8100,
plus other useful information and frequency files, etc.

http://ourworld.compuserve.com/homepages/Scan_PikesPeak/

Enjoy! Ken

Not having run this specific software, the first thing I would make
sure of is that I have a STACKS= statement in my CONFIG.SYS.
I generally (and quickly checking my HP100, this is what I have on both
the A: and C: CONFIG.SYS's) use STACKS=10,256.

>I can say for sure that wide FM starts working poorly below 2Mhz and is
>really bad below 1Mhz. I'm sure it's totally worthless below 500Khz.

Hey Steve,

It isn't the 8k that gives lousy reception on wide FM below 2Mhz,
it's the simple fact that there is no WFM being broadcast there, so
anything you Rx with WFM mode set, will be cross-mode demodulated.

(Mind you the frequency stability of some am stations have so much
frequency shift due to poor power regulation, there is enought FM on
the AM signal for very clear reception on nbfm!)

Come to that, as far as I am aware, WFM need only be used in the VHF
broadcast band circa 88 - 108 mhz and for TV sound reception above
500 mhz or thereabouts..

Someone is bound to point out that the the ruskies use 70 mhz for
their bc bands but seeing as mostly (but not always) they cant be
detected outside Russia and some of the (formaly) Communist Bloc
countries I dont count them!

>sgross@midusa.net
[SNIP]

ERrrrrrr - have I missed the point or something....

An Aluminium tab:

1) It hasn't got an aerial socket.
2) It doesn't have batteries (or other electrical input)
3) You can't open it up for cellular freqs
4) You can't put in a narrow band am filter
5) It is not illegal to have one in the car
6) you cant get it fixed at RS (or Tandy's!)
7) You cant do a discriminator mod to it.
8) It doesn't have a computer input or interface.
9) there is no earpiece socket.
10) there is no dial on it.
11) you can't "alpha tag" it
12) it has no multi channel capability
13) lousy at receiving ssb (or am, fm, cw, bo, bb, cb, tv, etc)
14) scan scan speed is soooooo slowwwww (see 12 above)
15) too light to be a paper weight or door stop.
16) too messy (and painful) if used as a paper substitute in the small
room!
17) No good as a condom
18) you cant swap it for a good s/h AR8000
19)It does not have continious coverage. A blooming great gap!
20) you cant get LAPD on Real Audio on it
Apart from that....

What the hell has this got to do with radio scanning anyway?????

Have a nice day....

>the extra wire? Thanks.

Hi Brian

What you have done by coiling the extra coax in a neat circle is to create an inductance that will have an effect on reception.

I would recommend that you un-coil it and "loose" the extra length by snaking it about in a random fashion..

It is difficult to advise if you should cut the excess coax out. Put it this way, If the excess is only a few feet, then dont bother. You will not notice the difference BUT if the excess is measured in 10's of feet or 100's of feet then YES cut it out!

Any feeder or coax will have inherrant losses. These losses become more into effect the higher the frequency. The losses are usually expressed as "attenuation in n db (decebels) per 100 feet".

Dont worry about this other than to understand that a loss of 3 db means 50 percent reduction in signal strength. (this applies to every 3 db step, so a loss of 9db equates to one eigth of the original signal.)

You can usefully use this information if you are comparing different feeder types. A feeder with say 3 db per 100 feet can be twice the length of a feeder with 6 db and still have the same signal strength.

As a general rule of thumb always use the shortest PRACTICAL length of feeder or coax that will achieve the job, but don't worry about a few extra feet.

Just one point about the coax on the TV mast. TVs (like computers!) generate a large amount of interferance (Hash) - If posible do not run the coax parallel to and close to a tv coax (Or house wiring in the loft.)

To minimise interferance pickup (crosstalk), ideally wires shoule cross each other at 90 degrees BUT this is not always practical.

All this being said, IF at the end of the day, you get reasonable reception and no percievable crud from the tv, then stop worrying

about db losses per 100 whatnots and enjoy the signals you are
getting!

Enjoy

Mike,

I've had mine for about 3 years now. I really like it but the manual sucks. Whoever wrote it must not get out much. I've traveled with it and have had no problems. Reception is very good. Works fairly well with the serial interface, but I understand you can up the port speed with a dip switch inside. Haven't gotten around to trying it yet. I think you will be happy with it if you can sort out the manual.

Glad to help Andrew, I am hoping that the FCC will open up a portion of
that band for the study of "cave radio" for amateur radio ops.
Frequencies that low, have a much better time traveling through rock, so
these frequencies can be used to talk to cave exploration teams.

There's Foothill Fire Dispatch which dispacthes all the small fire Depts in the Foothill area of the San Gabriel Valley, Sierra Madre, Arcadia, El Monte on 154.370, and 154.070 is used by Covina and La Verne, although I think La Verne has gone to 400mhz of late. Each department has specific unit numbers, Sierra Madre for instance has all it's units in the 40s, while Acradia has different numbers which I don't have in front of me at the moment.

> I've noticed that other counties such as San Diego, Ventura, Riverside,

> counties, I'd like them too. :)

For Ventura County, which is where I am, it's a lot easier. The channel colors correspond actually to the colors of the different department's apparatus, well at least they used to before everyone started changing colors.

Ventura County Dispatch is Yellow, they have Yellow rigs, the fireground channels are Blue, the rigs have Blue trim, and the tacticals are Brown,

Dunno why though.

Oxnard Fire's Dispatch is Green, they have/had slime green rigs

Ventura City Fire is Red, to match their Red engines, thier tactical is Gold, which is the trim on thier engines.

Fillmore City is Orange, has more to do with the city logo of an Orange, but you get the idea.

Santa Paula is Grey, I have no idea why though.

Chuck:

Nice to hear that someone else in the area is into "Longwave"! Yes, I've logged the Russian outlet on 189 Khz - as well as 153 Khz, and 243(?)Khz. But definitely not using the AOR AR8000 (what could one expect on the LFs with a radio that is smaller than one of the RF coils on my RBL TRF)! Some of my best LW & BCB loggings have been on tube sets, the surplus RAKs and RBLs for Longwave and a Collins R-392 (24v - portable version of an R-390) for MWDX.
Lately I've been listening on an R7 & R8A and an NRD525. The Japanese MW outlets have been Q5 around local sunrise and I managed to copy over an hour of JO(IB?), 774 Khz for a reception report. They program "English Lessons" during the time period - makes it a easy log. Some mornings I can even listen to them on my way to work in the mobile.
Finally, Chuck do you know of any "Lowfer" activity in the area? Twice I put XMITTRS on the air - the first in the early '70s, a circuit in Popular Electronics; the second a DSB in the '80s from Ken Cornell's "Scrapbook". Couldn't raise a soul...

>ever seen. I hate those cell phones!" I told him that maybe it looked
>stupid to him, and maybe it looked stupid to me, but how was that lady
>harming anyone? He didn't like that answer.

Now that you mention it, I don't like them either. But my only gripe with
them is when idiots talk on them while they are driving and don't pay
attention to what the heck they are doing. Yes, I can see how backpackers
would use the phone as too much of a lifeline and not realize that a
flip-phone won't transmit 20 some odd miles to the nearest tower unless they
are at the top of the mountain with a clean line of sight. Bag phones with a
good battery are a necessity in this instance. BUT, it is not difficult to
jam a cell tower! The cell tower scans the channels for open ones to put a
call on when it receives a request for a dial tone. If it finds no open
channels, It's dead in the water. Any signal generator that covers those
frequencies placed at the base of the tower would do in that tower pretty
quickly. Even more precise would be to jam out the paging channels. Maybe
somebody should call AT&T and tell them about those posey sniffin nuts who
plan to deprive them of their bread and butter.

Not any that I know of that are directly paid for listening, but
various news agencies and independants, especially photogs (there are
a few here), rely heavily on scanner traffic to "beat the
competition".
There are also "professionals" of many other bodies that use scanners
extensively, although not necessarily directly related to their
profession. Law Enforcement, Fire, EMS, PI's, Racers of all sorts,
etc.

Mark

The truth as I perceive it to be.
Your perception will be different.

3114. Help: AR2700 & Home Made Scout Port & PC I/F!!!???

Newsgroup: rec.radio.scanner
Date: 1996-11-04 00:00:00 UTC
From: dmitton@mulberry.com
Message-ID: <55jep3dsp1@gollum.kingston.net>
Source record: 218548

You may remember me posting a few questions previously ...
Well, now I've gone and done it ... :-)

1) Installed the Scout Port Mod
- I used the instructions located at
http://www.mv.com/users.wje/jack_howto.html
- Also used some great email ASCII art from
csmith1@CCGATE.HAC.COM (Thanks)
2) I continuity checked the connections with a BLANK 3.5mm jack
plugged into the port before re-assembling ... only the proper
connections, no shorts.
3) Constructed the level translator PC interface
- Tried both
http://www.hollis.co.uk/john/ar8000sl.html (resistor / zener)
http://www.mv.com/users/wje/rs2322.html (dual transistor)
- Also tried the 9vdc power supply modification suggested by
John - R2D2 <rtwodtwo@cwnet.com>
4) Used the terminal parameters supplied by 1 above ...
9600 baud, 8 bits, No Parity, 2 stop bits
Tried both upper and lower case.

The scanner works perfectly well as long as I don't plug into the
scanner.

The I/F won't work!!! In all cases, the AR2700 display indicates
"SERIAL" when I plug in the cable BUT nothing else happens. I have to
cycle the power in order to get control back to the key pad ... while
removing the serial cable.

I'm also using the AR8000 command reference, I haven't seen any
commands specific to the AR2700. I did try the demo "ScannerWEAR
SoftControl 2.0 Demo" which came with my scanner ... still no go,
it just times out and asks me if the scanner is connected!

Has any one else had any experience with doing this mod themselves?
Any input, ideas, criticism, ready humor to throw some light on this
problem???

Thanks in advance!!!

Maybe we should give Drew the benefit of the doubt and assume that he
was merely referring to the rioters' behavior and not implying that
they had tails or anything :)

****
This works, I did it and have already received $682.00 in the past week
Seriously.
****

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like 'desperate stupid people who will try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new Circuit City Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right away. I can smell a money scam from a mile away these days, SO I THOUGHT....
I thought I could sniff out a scam easily. WAS I WRONG!! ....I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50, 0000 IN CASH WITHIN 4 WEEKS! Well, the more I thought about it, the more I became very curious. Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe a tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me To

Your List." I then removed the first position name of the five names listed and moved everyone up one position, and I put my name in position five of the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so.... But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world-Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 one dollar bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the mostdetailed, yet straightforward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following:
"Please add my name to your list". This creates a service out of this money making system and thus making it completely legal. You are not just randomly sending a dollar to someone, you are paying one dollar for a legitimate service. Make sure you include your name and

address. I assure you that, again, this is completely legal! For a neat little twist, also write what slot their name was in: "You were in slot 3", Just to add a little fun! This is all about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money orders), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up slot one on the list. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address, zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin boards' message areas & file section as possible. Give a catchy description of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!! If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever.

Just make sure it represents its true feasibility, NOT something like..."Get one million dollars flooding in your mailbox in two days!"

You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

9. (This step added by Charles Reiley). Hello, This is exciting, isn't it?! While I'm on the list, just add a note saying "Please include extra money tips" with your name & E-MAIL address, and I will (FOR FREE) send you some neat methods to increase the money you will receive with this plan. Why?... Why not? I'm not a selfish jerk...I like helping out others. E-mail just makes it a touch easier and cheaper, too! After I drop off the list, I can no longer offer you this advice, obviously, but maybe someone else who gets my tips will offer and simply replace my name on this step number 9. Good luck and give this plan your all, it will definitely pay off! Like Mike said, HAVE FUN WITH IT!!!

10. (This comment added by Mike Lorincz) Hell dude, this is great, just send the money and wait like 1 week, then all of a sudden, BOOOOOOM! Mail flood full of dollar bills. Hahahah its great

I have an Autin antenna called the Condor (looks silly). There is
another antenna that they make called the Spectra. It is a magnetic
mount, and works EXCELLENT. I do not currently own one, but have seen,
tried it out, and heard great reviews. The only thing is that it is
about $70.

For $35.00 they'll sell you a new pack, your best option. The
battery mod did zip for my unit. At 6 years old I have had it
overhauled by U... twice. They sent me new units for $55.00.
You can't beat that.

The scout connects to the 8000 Via a mini plug style connector. If you buy both of these from the same store, chances are they have installed this connector on the aor 8000 for you.

However, if you want to use your 8000 with your pc, you need to buy the cable that hooks it up to your pc's 25pin parallel port, via a small card style connectort located just under the battery tray (you have to open the door to see it).

>
>

>
To the questioneer of the minute!

What scanning equipment the pro's use is usually anyone who uses info gleaned from the info given for any gain.

Money....facts for an article or for a book.
Non-monetary would be listening for things heard by agencies that impact upon a community's well-being....adversely so.
An early warning system so to speak.

Fire depts use scanners to listen to other fire depts. This gives them an edge when mutual aid is called. They are ready by the time the M.A. calls go out.

CHP listens to the police depts which they cruise through so as to know when chases begin or bank robberies occur or kidnappings, etc. Most Chippy's have a MR8100 in their cruiser.

The dispatcher's office in Antioch and San Fran also have them...for similar reasons.

Police depts use them....to monitor neighboring police depts to know same as CHP does.....to be forewarned.

This is what the PRO"s use as intended. But Pro also means newspapers and tv stations and professional cameramen/women wh0o do freelance breaking news. They all depend on the scanners.

I'm a pro videographer who chases breaking news events. I am also a still photographer who occasionally brings out my 35mm's for the unusual photo to sell to newspapers.

But there are other ways I earn money with a scanner. And for this I get paid for what I hear geared to the client I hear it for...

That is what is meant by the pro's use of. Whether or not that is true based on the ad's message...only the client who pays to run that ad will know how it works for them....

I really don't know what they mean by PRO equipment....amateurs who listen to scanners for fun use the same stuff as I do. Some have better stuff than I do...but then too, I base my inventory used on what I need it to do for me for what I want when it is breaking.

I have nine scanners at my base and five in my car. Plus about eight others that are collecting dust. Have been doing it for many years....new models come out and are better and so they old ones get laid off.

The pro's are the users who get paid for the results they hear and the use to which they are applying it towards....

the rest is all HYPE. After all, there are only three or four makers of PRO equipment used by Both PRO and Non-pro.

What is also nice about scanners is that they allow video used today by the media to be bought years later for re=use by new tv video feature series...like Real TV. Just sold a past video for use again...so it's kind of residual income.

A lot of my video was sent to a Video Clip House and I get checks when ever that video is used by one of their clients.

That is how this pro gets paid using a bevvy of scanners.....

It also enabled me to write a book based on my news activity and got me speaking engagements and more. Plus some other projects I am working on .... all because of a scanner.

And because of those scanners I have had two major newspapers do stories on my still photography news activity and tv news activity.

Ok.... Now the $64,000.00 question is... Where did you *get* them? I've been looking for a set for *months* now! (I've become a `day sleeper' because of certain circumstances and with a hyper-active 4yr old and 4 dogs it has become fairly hard at times to get *any* sleep some days.)

3132. FS: Message Tracker Pro Paging Decoder

I am selling my Message Tracker Pro paging decoder program which decodes Pocsag & Golay (numeric & alphanumeric) messages from your scanner.

Includes: * Program on floppy disk

* Users's Manual

* Serial Interface Adapter (from computer to scanner)

This "Pro" version allows you to capture all messages from the frequency you are monitoring. You can also monitor specific capcodes only, instead of receiving everything.

Many features.

Price is $100.00 - I'll pay first class mail/Insured.

Originally cost $239.00. Must sell because of interference from local cell and two way repeaters 700 feet from my home.

Steve

I assume that you want some sort of comprehensive listing as opposed to trying to gather dozens of old sectionals (by visiting airports across the country) and transcribing info from the sectional to some kind of database.

Almost all of the lower-end flight planning programs I've seen access a simple ASCII file for lat/lon info on VORs and airports. If I were doing a program I would just take one of these files and use it for my reference file. NAV4 is one such program, and you should be able to grab that at any aviation site or in the aviation forum on CompuServe. Just for grins, I might try the FAA's web site because there are several databases there and you might get lucky.

Good luck.

That may or may not have been the actual case in your city during the particular incident, but it seems unlikely. My experience in Public Safety (18 years or so) tells me that there are a LOT of minority crime victims, as well as minority perpetrators. Minority criminals victimize EVERYONE - they don't deliberately avoid members of their own ethnic group.

I expect (hope??) that some laws get passed about this in the near future. Especially with the proliferation of those teeny (and cheap) TV cameras which can be hidden almost anywhere. Perhaps a law requiring that people be notified by sign if there are cameras around. Surreptitious video-ing of people would be a violation similar to eavesdropping with microphones or other audio bugs.

bdoreste@one-thirty-nine.univ-commons.udel.edu (Brian Albert Doreste) wrote:

>I have tried to use the Semasoft POCSAG decoder, but the only message >that I get is 'PREAMBLE' and I can't get anything to decode.

I have been following this thread with some interest.

Although I do not have the said software, I have done lab tests on the recovering data signals via a speaker/earphone socket on vhf receivers.

You may be interested in the following observations

1) Data received via the speaker.earphone socket is severly modified by the filtering and audio amplifier of the radio. This modification "rounds" off the corners of what is best to be "square" corners. There are also other modifications to the wave form. These all add to give a distorted data wave form

2) The level of the data from the speaker/ear socket is adjusted via the volume control. If you are feeding this into some sort of interface, beit a schmitt trigger or beit a sound board, the level is usually VERY critical. As you change the level, The wave form can be further distorted

All this adds to a dissapointing result. If there is any reasonable amount of distortion, then only the lower data speeds may be decoded, and even these may be corrupt

The BEST way by far is to take the data audio directly from the discriminator output. Feed this through a schmitt trigger to "condition" the signal and then feed it into the computer/sound board.

In one set of tests I conducted, I achieved about 30 percent reliable data recovery at 512 baud, Nil at 1200 or 2400 baud when using speaker/earphone sockets. (FRG9600 and similar with the AR8000)

When the data was taken from the discriminator and conditioned via a schmitt trigger circuit, the data recovery shot up to 100 percent 512 & 1200 and 95 percent at 2400 baud (FRG9600 - I have not yet don a discriminator mod on the AR8000 as yet)

I think the above info speaks for itself. Dont blame the software -It might be jolly good. I suspect the audio beinf fed to the computer is just not clean enough.....

BTW: I do have a detailed discription on how to modiy the FRG9600 for
a discriminator output - I shall repost it in the near future...

Have fun.

I recently bought a used BC855XLT and would like mod. info. I have already located some info that refers to some jumper wires near the edge of the board next to diode 210 or 201 but my unit is apparently newer because it has surface mount parts. The serial number is 45002657if that helps. There is a small stand-up board soldered to the main board labled "Window Unit". It has several SM components. Would this be the 800MHz Cel Tel block? I would really likeam more interested to know if the memory can be configured to 100 channels as described in the mod. for the older units.

Please e-mail.

Then I don't suppose you'd like to explain why POPCOMM is over
a year in arears in paying their writers? I've spoken to several and
received the exact same story.

But to be fair, I am also given to understand that under your helm
writers are now starting to be paid again.

Is POPCOMM going to play catch-up with their back pay which
is generally over 12 months overdue?

TO: Harold Ort

I recently received a request from POPCOMM to resubsrcibe.
I'm sure you didn't read it, but I added a not with it that said:

"I refuse to subscribe to a magazine which refuses to pay
its writers, especially since POPCOMM is over a year in
arears". That still stands today. You bring your writers
up to speed in repayment, and I'll resubscribe. Until
then, you're on your own.

Hi ronkatz!

ronkatz@interlog.com wrote in a message to All:

ri> I was told that Oshawa "ambulance" is now on a GE trunked system.
ri> Any one else heard this?

Nope not yet. They have been using their pager alot more then they used to, which is a sign that they will be moving soon. I don't think it will be till the first quarter of next year. I heard that they got a temp licence for testing in Oshawa only, via Williams Communications.

The freq's I heard about being used are:

858.1375
858.3875
858.6375
859.1375
862.5375
862.7875
863.0375
863.2875
863.5375

The 410 and 414-415 MHz repeaters will remain in place...

This is a good scanner and you did great by getting it for $15. I
already
have one and would get another for a bit more than $15!

Get yourself some AA rechargables (Radio Shacks are OK) and use the
charging
jack already there (red) on the side. I'm still on my first set of
batteries
and have cycled them a few dozen times and still get good results from
the
batteries. The scanner beeps when they get low.

The 37 compared favorably to a comparably-priced bearcat (I forget which
one)
that I borrowed for a bit; I preferred the 37.

The 37 used to sell in the $200-300 range and I think was replaced by
the 39.

My dislikes: The keys are small and sometimes "stick". I get the
feeling that
the keys don't have a long lifetime. The case seems fragile and I would
not want
to drop it anywhere.

I agree Brian, it is alot better to come of the disciminator to read pocsag and other protocols. However, after 10 years of buying hardware to keep up with the ever changing digital radio communications, it is a pleasant change to plug in my sound card to the earphone jack of my scanner and get results. The author of semasoft, Rene Hagen, is making great strides in an area alot of people said "can't be done". In the beta 32 bit version of semasoft, there is a righthand bitsquare width adjustment to tune the "rounding off" of the waveform thus enabling alot more than 30% good copy. Keep hitting Rene's pocsag page everyone, I cannot send my copy as it is registered to me by the author for beta testing. Any further questions should go to Rene too. Well, I am off to do some more decoding! Toodles!

Tommy Johnson
radioman@texasnetwork.com

PS. If anyone has ANY other software only decoders (DTMF, morse, rtty, wefax, etc) please mail me!

I drove to Kitchener last night and also checked out Cambridge. I
confirmed that they have in fact switched over to a GE trunked system.

Only Beeping at the end of transmission, no Buzz Saw noise.

I talked to a few tow truck drivers who supplied me with about
40 frequencies but I can only confirm 10 of them.

I once hooked up my PRO 34 to my TV antena.

I had the antena wire attached to a cable wire and then I used an
adapter to attach the cable wire to the BNC jack.

It worked good. I heared New York crystal clear from Monmouth County,
New Jersey Next to Asbury Park. I picked up cordless extremely well

I normally would not get such good reception on the little rubber
antena. And I Never hear NYC PD on the stock antena.

I did this once with one of those cassetes that allow you to play your
discman in the car. It sounded good and I could crank the volume up loud
enough to hear the scanner while working in my yard. Give it a try. As
for the LF door only, is this a factory stereo? Do you have an equalizer
(preferably line level)?

Doug,

When you try sending commands to the scanner did you remember to
send CRLF after each command? (You need an ASCII 13 followed by an
ASCII 10.) A terminal emulator sometimes will send a 10 if you hit
Ctrl-ENTER. Thus, type AT1 followed by ENTER and then Ctrl-ENTER
and see what happens. The attenuator should go on (AT0 is off).

Otherwise, I suppose it could be your hardware.

Good Luck,
Ray

Newsgroup: rec.radio.scanner
Date: 1996-11-05 00:00:00 UTC
From: Ray Linton <linton@mhv.net>
Message-ID: <327EFDED.3F34@mhv.net>
Source record: 218433

Todd,

I noticed that the scanner doesn't like to stop on weak signals.

Try adjusting the squelch detect time (see page 61). The default is
15 - the boys on the 'Net suggest using 5. This doesn't make it more
sensitive, just more likely to stop on a short squelch break.

Some people are actually changing a resistor inside. I haven't gone
that far - yet!

A better antenna helps. I haven't tried a preamp. Make sure the
attenuator is OFF!

Good Luck,
Ray

That beam stinks!

I bought one new and tried it on 2m , 70cm, and 6m all with lousy results.
The anteann gave me lousy SWR and contrary to what I was told when I
bought the antenna it was not directional on 6m (according to someone at
grove who I spoke with after experiencing the antenna).

Save the money on the balun and get another antenna.

PC or not, it is a very inflammatory term. Had you said "animals", you would have made a strong enough point. Adding skin tone as an adjective just perpetuates stereotyping. I know you are probably not a racist but because there are so many still around, even the non-PC types can feel embarassed at this. (Unless you yourself are an African-American then my fullest apologies).

Steve S.

P.S. Did anyone supply the police freqs you were looking for?

Ok, I am going to try and post this message again. Rene Hagen, author of semasoft has a 32 bit version in beta. This thing rocks!! I am getting nearly 200 pages a minute during busy times and the only bug so far is occasionally when you try to close the program, it hangs. Rene is working on a fix before he release it. This version also has an rh adjustment to further let you tune it with your scanner. Support this guy and mail him with your interest and he may send you a beta. Also, the 16 bit version now works under 3.11. I was getting only preamble before and then GPF's but now it works fine... The only change I made to the system was an updated (and correct brand) driver for my sound card (sound bravo-16) which is a SB pro clone and I upgraded to the latest win32s also. Now it doesn't crash and works fine.... Go figure. The 32 bit version is the better of the two though, I seem to get ALOT more decodes with it than the 16 bit.

If anyone has the DTMF software decoder and any other software only decoders please mail me.

Hopefully my ISP will get this message POSTED this time....

Durigan's defense of his use of "black animals" would be laughable if it weren't so pathetic. Tell me Durigan, do you walk upright or do your knuckles still drag along the ground? And, have you seen a doctor about getting medication for that constant drooling?

Durigan is a piece of lowlife trash. He's the worst sort because he is the sort of filthy vermin who is incapable of seeing himself for what he truely is.

He's ridiculously termed this a case of PC! You single out a group of people based on their color and attach the word "animals" to them and then you argue that the only ones that should object to this as being politically correct. That is easily the lamest argument that I have every heard from a red-neck racist. It stuns me that morons like you have jobs, own computers and write. You've managed to go far without an education. Happily, scum like you will soon be extinct. You're too stupid to feed yourselves.

I am looking for a scanner that is pretty cabaple; I am from europe and
will use it mostly over there, however, I will use it in the states while
I am here (till spring of '97).
Is that a good scanner at a good price? I usually listen to SW on my
little sony receiver, and I am not too familiar with scanners. Can I pick
up SW bands with a scanner, and what is the battery life on a hand held
scanners? Could somebody give me more advice/information? Thank you!

Hi
all, just got these mods, hot off the FAX!

Note: It is not lawful to monitor cellular or conventional mobile
telephone
conversations.

The 2026 has cellular frequencies deleted at the factory,
but
restoration is the easiest ever! - clip one marked wire! All you need
is a
Philips screwdriver and wire cutters.

1. Turn the scanner u
pside-down and remove the four side screws
holding the bottom cover in place; pull
the cover loose and set it
back about two inches out of the way.

2. Locate the small
circuit board at the lower right-hand corner and
find jumper L201. Cut it and
slightly separate the break.

3. Reassemble the
radio which now has continuous 806-956 MHz coverage
and 30KHz search increments in
the cellular band.

*** I have not tried the above mod, but did acquire it from
a
commercial radio dealer who is very respectable, so as always, proceed
at your own
risk and realize that this will violate your war
ranty!

Have Fun!

Message-ID: <19961105162700.LAA11251@ladder01.news.aol.com>
Source record: 218461

There was a TV program about a paticular case that involved an apartment owner having a video behind a two-way mirror, and the tennants found out about it. The only thing they could get the owner on was the video camera had a built-in mic because there doesn't seem to be any laws against filming people when they don't know about it. I would assume that receiving a video signal would be no problem, as long as there is no audio. Who knows???

> |_/ ___} [__ || \\ ][__, |_/

The PRO-2004 scanner can be used to receive cellular telephone
conversations.
Originally, the scanner was able to receive in this
band, but at the last minute, it
was decided to delete cellular
coverage from the PRO-2004.

The procedure to
re-instate the cellular band is simple for anyone
with
a pair of cutters, and a phillips screw-driver.

1. Remove the four screws from the
back of the radio, and slide
off the cover from the chassis.

2. Turn the radio
upside down. You will find a metal box-like sub-
chassis in the center of the main
chassis. Remove the cover and
you will be lo
oking at the CPU, a 64-pin integrated circuit.

3. Examine the component side of
this board, and you will find a row of
diodes and resistors. On one end of the row
you will find a diode
labeled D-513.

4. Clip the accessible end of D-513, and pry
apart the ends so they
don't touch. You have
just restored cellular coverage to you scanner.

5. If D-513 is not there, it may
be located on the underside of
the circuit board.

*** Information was extracted
from POPULAR COMMUNICATIONS Aug 1987.

*** File appended: more mods for the
scanner

Subject: PRO-2004 MODS HERE THEY ARE !!!
Keywords: AGAIN
!
Date: 12 Jan 89 14:34:39 GMT
Organization: Raytheon Co., Bedford, Mass.

I
guess it's time to post this article again. As always do these mods
at your own risk.
I assume no responsibility. 73 & good liste
ning

Gene WA1UXA

These mods are
detailed in the following articles:
a) POPULAR COMMUNICATIONS AUG 87, PP 18-20
b)
MONITORING TIMES OCT 87, P 53
c) MONITORING TIMES DEC 87,P 60
I suggest strongly that
you obtain the back issues and read through
the letters
or articles. I also suggest you subscribe to the mags. They supply a lot
of
great info and freq lists. Now the mods.

1) Restoring 870 MHz coverage.
First
treat the radio as if it were CMOS, that is make sure you and it have no
built up
static charges. UNPLUG THE RADIO FROM THE AC OR
DC POWER SOURCE AND
ANTENNA !!!!!!!! Take the radio out of the case by removing the
4 screws on
the back. Carefully invert the radio. Locate a box-like sub-circuit.
It's
near the switch marked "restart". The sub-circuit should be marked
PC-3.
Carefully pry off the cover of the metal box. Inside
there will be a 64 pin dip

IC. This is the radio CPU. Be careful not to touch or
short out any leads on
the chip. Near the chip there will be a row of diodes marked
D-502 to D-515.
If D-513 is present, cut one lead, separate it so they will not
touch, and
magic, 870 Mhz is restored. If D-513 is
not there and you still do not have
870 coverage, then a little more work is in
order. Locate the 9 pin connector
"CN-501". Carefully remove it from the sub-circuit.
Unscrew the screws holding
PC-3 to the main chassis. Carefully invert the sub-circuit
board (PC-3).
Locate the one lone component
on that side of the board. If it is a diode,
as it should be, then cut one lead and
separate them as above. Re-install the
sub-circuit with the screws on to the main
chassis. Reconnect the 9 pin
connector. Do NOT put the cover back on just yet ?!

Subject: Trick the old Bearcat BC-220
to search 136-144 MHz
x
Trick the Bearcat BC220 to

Search 136 - 144 MHz

Here's a trick for altering
the frequency limits of the
early version of the BC220, which appears in
Grove's
"The Best of 1982 Monitoring Times".

I no longer have my BC220 and
haven't tried this trick.

To search 136 - 144 MHz:

1. turn the set off
and on to clear the memory
2. manua
lly select any channel
3. enter 136.0 MHz
4. enter 144.0 and press
LIMIT
5. press SEARCH (reads ERROR)
6. press LIMIT (reads 136.0 MHz)

7. press SEARCH

You may restrict this out of band search sequence

further once steps 1 through 7 h
ave been executed.

While the receiver is searching, open the squelch at

whatever frequency you would like to select as the
upper search limit;
then:

a. press 136.0 LIMIT
b. press SEARCH (reads ERROR)
c.
press LIMIT (reads the frequency at which
you
stopped searching)
d. press SEARCH and close squelch again
to resume
searching

A number of frequency ranges may be substituted
for the
example above, but only in the early versions of the
BC220 with
the older microprocessors.

3208. Re: Is This True?

Newsgroup: rec.radio.scanner
Date: 1996-11-05 00:00:00 UTC
From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <327F756C.41C6@vnet.ibm.com>
Source record: 218464

No one suggested sticking a wire into an AC outlet. The idea was
to make a connection to ground via the outlet faceplate screw
which screws through the faceplate into the outlet box. If the
house wiring is up to regulations, the outlet box is grounded
thereby facilitating access to the house ground plane.

Strong signals,
Rich Wells

They have a set of 5 channels in the 418 MHz range. Maybe
that's where the new trunk is located.

Oshawa FD is trunked on 800 MHz already.

ForSale:

OptoElectronics APS-104 Active Pre-Selector
-Tunable band pass filter system
-10MHz to 1GHz
-Continously tunes over more than 5 octaves
-Maintains a constant 4MHz bandwidth over entire range
-Electronically tunes
-Ultimate Security Sweeper
-Extend Near Field detection distance 10x
-Includes Internal Rechargable battery pack and charger

New this is $900 from Opto, I am asking $550 or best offer

The unit is in perfect conditon, and has seen very little use.

The perfect use for this is in conjunction with the Scout or Explorer, it provides a very significant boost in capture range.

I was using it with the Scout/AOR-8000 combo and it worked great.

I purchased this for a project and no longer need it.

I'm attempting to revive a long-dead Uniden BC-100XLT handheld scanner. Thanks to Bob Parnass for getting me the info I needed to get the replacement part I needed.

Unfortunately, with a new battery, the scanner still has a problem. Everything works great except the audio. It's muddy and low. I suspect a bad bypass capacitor in the audio amplifier. I'm kicking myself for not ordering a service manual when I ordered the other parts, and am hoping that someone with a service manual can provide part numbers for the audio caps so I can order them along with the service manual. Or better yet, the location and value of the cap so I can attempt to replace it without going through Uniden parts..

NOAA has installed a new Weather Radio transmitter near Port Townsend, WA.

The freq is 162.425 Mhz, with links on 410.575 and 415.900 Mhz.

The signal originates out of the NOAA/NWS offices at Sand Point, in
NE Seattle. Sand Point is on Lake Washington and is a former U.S. Navy
Air Station.

The callsign is WWG-24 and it's sited on Miller Pk (or possibly Blyn Mt.),
which is west of Port Townsend, east of Port Angeles, and south of Gardiner.

Coverage area will be the Strait of Juan de Fuca, San Juan Islands, and
northern Puget Sound.

Broadcasts will emphasize marine info.

I first heard a test signal Sunday Nov 3, with an updated message being
sent Tuesday Nov 5th.

During good weather this past summer I became aware of a 747 departing Sea-Tac airport on a straight out departure when runways 34 were active.

I am about 15 miles due north of Sea-Tac and the plane would fly right overhead as it continued it's lumbering climbout as it flew northward.

Binocular inspection indicated it was a British Airways plane (red stripe wraps under fuselage). Listening to Clearance, and Departure freqs I heard it ID as Speedbird 6718. I know that BA identifies as Speedbird, but when I got on the BA web page I found the flight leaving Seattle for London had a flight number of 082, not 6718.

Can someone tell me why the different numbers?

Also I am able to "follow" this flight until it gets into Vancouver Center (CA) control on 133.500 (or was it 133.700, I forgot my notes).

A "project" for the group:

Try and follow this flight as far as we can as it flys across Canada, noting the freqs it gets handed off to (and which ARTC).

Subject: Plugging a scanner into a car stereo-any ideas?
From: Brian Varine <varineb@ucs.orst.edu>

>Just wondering if anyone has any experience hooking up a scanner to a car

>stereo. I'd like to plug my scanner into my LF door speaker. I know it
>can't be as simple as connecting my scanner output to a cable.

Got a cassette deck in the car? Buy one of those cassette-like widgets
that allow you to feed the scanner's audio through the car system.They
cost about $15-$20.

Does anyone know of a source for a replacement battery for a Cobra SR15 scanner. Its part number was(is) BP-15. It's a four-pack, 4.8V. I understand a Bearcat model uses the same pack with a similar connector, only with reverse polarity (easily modified). Any help would be appreciated.

Kevin, I've had the same thing happen to me and so far I haven't blown anything up. I don't plug the scanner into the stereo though. My cb comes through the stereo by itself. Try moving your cb and your car radio or your scanner antenna further apart if you can. I haven't blown anything up yet, but I'm always cautious to try to disconnect the scanner antenna when I talk on the Chump Band. I use my 2 meter ham radio antenna for my scanner antenna, so I rarely have both of them on at the same time. I wouldn't want to run 5 watts from my HT into the scanner antenna at that close of range if I had a scanner antenna. Hope this helps.

I found this page on the Web, thought I'd pass it on to anyone in the Richmond area who might be interested. It's a document created by the Society of Broadcast Engineers in the Richmond area listing all the auxilliary frequencies (and their uses) used by radio and tv stations in the area. It's got wireless mic frequencies, in-studio cueing frequencies, traffic report frequencies, repeater freqs, etc. I wish I could find something similar for where I live!

What's with everyone's affinity about cutting diodes off?

Desolder it and then move it over to speed up the 2004.

2. Add a 1N4148 to the empty spots for D-510 for 100 more channels.

3. Add a 1N4148 to the empty spots for D-514 for a 25% speedup.

NOTE: DO NOT ADD A DIODE TO EMPTY SPOTS FOR D-511 or D-512. This will
alter the cellular spacing steps and other ungood stuff.

Apparently, so am I. I read a technical book on TV signals
and servicing several years ago that repeatedly used the
term "subcarrier" to describe any of the discrete signals
within the TV channel envelope.

When you transmit on your CB you're totally overpowering the receiver in the scanner. If it isn't picking up the CB frequency (27.xxxx MHz) directly, it's picking up a harmonic of it since the signal is so strong relative to the other transmitters around.

I get the same thing when I use the cell phone in the car when the scanner's turned on. The scanner stops on the first 800MHz frequency (sometimes the first 400MHz frequency) programmed in and the caller and I get to listen to some wonderful feedback.

I think you're just going to turn off the scanner (or turn it's volume WAY down) when you want to transmit with the CB.

This is what scanning is all about...

Tuesday night (11/5) about 10-10:30 I turn the scanner on before bed, after elections, and since I include P-MARS in my normal bank, I hear the MD State Police are chasing a stolen Baltimore City bus. I picked up the chase on the GW Parkway in VA. Headed south, it reaches Mt. Vernon and turns around and heads back north on the Parkway, eventually entering Wash. DC...at this time there are 3 or 4 helicopters, US Park Police, Alexandria City Police, Metropolitan PD (DC), Fairfax County Police (you get the idea...everyone was there). The bus heads through DC into MD (PG County police now involved), across the Woodrow Wilson bridge on the DC beltway and back into VA where the VA state police now join the pursuit. (Broadcast TV coverage the next day says at one point there are 33 cruisers involved in the chase). Bus speeds range from 50-60 mph. At least two different types of devices to blow the tires by at least two different jurisdictions were tried at least 4 times...only succeeded to damage cruiser tires. Apparently the bus tire treads were too heavy. By now most of the action is on the VA State Police freq. along with a play-by-play from the helicopters still on P-MARS. Bus slows at least once but continues...by now cruisers are dropping out of the chase because of fuel. All jurisdictions did a great job anticipating the route the driver was taking and getting pedestrian traffic out of the way. To get a description in case the driver bailed, one cruiser got "close enough to kiss him." The VA State police were preparing a cruiser with a shotgun to take a shot at the engine...the compartment was open, but never resorted to trying it. Finally around Culpepper, VA the driver swerves the bus and flips it. Suspect taken into custody around 2am.

All in all, chase lasted at least 3 - 3 1/2 hours and 180 miles, starting in MD, into VA, into DC, back into MD, then back into VA...in a bus! Congrats to all jurisdictions involved...no serious injuries, most of the damage was to parked vehicles. And this driver was very active in ramming cruisers and other cars when they came close enough.

Kind of a real life SPEED.

Best of all....I got to listen to it all. Exactly what this hobby is all about!

Anybody else catch any of this? 73's

> Thanks
> Kevin
> kmud@cris.com

You probably won't "fry" anything but it is annoying, isn't it? Your CB is probably being picked up by the cassette device - probably on the cable that runs from the scanner to the cassette deck. I would have also suggested that your stereo speaker wiring could be the culprit but you didn't mention having a problem with the cb/stereo combination before.

You might be able to choke off the RF on the wire with a ferrite device installed close to the stereo. A couple of wraps around a toroid might help - a snap on ferrite bead or two may be sufficient.

You didn't mention if you were "running power" on your CB. If you are, you might try to go "barefoot". However even a legal, stock CB can cause the problems you describe - it pretty common due to the fact that CB is A.M. and operate at a relatively low frequency. Your wiring is probably just acting like an antenna.

Regards

The Society of Broadcast Engineers seems to do this for most areas of
the country, for frequency coordination. Maybe if you could find a local
chapter and ask nicely enough, you could obtain a copy for your area.
I got a copy of their lists for the El Paso, TX/Las Cruces, NM area
from a friend of mine who is chief engineer of one of New Mexico State
University's radio stations - he needed to pick a frequency for a new
remote unit that they're getting (KRUX-FM remote, at 450.150 MHz).

I'm not sure if I heard FRS or GMRS interstitials but I surprised some kid who was talking to his Dad on INTER 1 (FRS 1). I asked for his callsign but got no reply except "Did you hear that? (to his Dad presumably)". I'll keep challenging for GMRS calls to determine if its FRS or GMRS.

Also, I believe Tandy decided to begin with only the upper 7 to avoid interference to exisitng GMRS INTER users hoping that their modulation, power, and bandwidth specs will prevent GMRS repeater intereference. A good idea I guess. I understand Motorola is offering all 14 channels which is probably what I heard.

we call them "subscribers" in the business ...

> "directly" transmitted on the frequency you pick. It is a two-way link
> in a full-duplex fashion so, you need two channels: one for uplink and
^^^^^^^^^^^^^^^^^^^

it IS "full duplex" (strike the word fashion) except in
digital cellular (just kidding)

> carrying the owner's audio (low power, short-range) and another for
^^^^^^^^^^^^^^^^^^^^^^
Huh?

> downlink coming from tower sites (high-power, longer range). You
^^^^^^^^^^^^
I have a question, if it's full duplex, why is greater range
needed on the downlink (Base Station to subsriber equipment)
needed? We strove to obtain what's known as a 'balanced' system
(uplink to downlink) in the cellular systems we designed - and
(generally) achieved it. We failed in those cases where we were
protecting our service area via extended 'Carey Contours' from
250 Watt ERP base stations in RSA (Rural Servive Areas) as opposed
to in the city.

Cellular systems engineering is like a lot of other technical persuits
...
things don't just happen nor is it 'magic'.

> usually pick the downlink frequency and, therefore, "only" the far-end
Right on ...
> audio. Phone land lines usually suffer from a so-called "side-tone"
^^^^^^^^^

"Side-tone" is desired in the earpice of the phone the 'talker' is
speaking into. This was discovered years ago - it was more 'natural'
feeling while speaking, consequently it has been standard in (most)
all equipment.

The effect you are referring to is (usually) poor RL ("Return Loss")
on a two wire POTS (Plain Old Telephone Service) line. This can be
caused by a number of things inluding bad four-wire to two-wire
hydrids, mismatched POTS lines (the approx 600 Ohm twisted pair
from the CO to the analog phone isn't properly terminated - they
rarely are).

This 'electronic echo' (sent from the mobile subsciber and 'bounced'
off the far end of a mismatched analog line) is created in the
"last mile" of the loop. (The silly little '600 Ohm' two-wire twisted
pair POTS line that runs from the last switch to the analog phone
in the house.

> effect: you may hear both channels mixed on the downlink because only
> one physical line is used and audio separation is not always perfect.
>
> So, you might only expect to hear one audio on one channel, usually
> the downlink one, but an unwanted side-effect of the land lines mixes

On a good call to an office with a digital PBX (and all the phones are
digital like there were in our office) you will hear only one side.

> a portion of the uplink on the downlink. The amount of uplink mixed
> depends on the particular characteristics of the land line allocated

One way of saying it ... but I wanted to be specific as to the cause.

> for each conversation.
> You will never hear the downlink mixed on an uplink channel.

No arguement here

>
> Hope it helps.
>
> Jordi.
> (ea3aai@lix.intercom.es)

A question was asked earlier in this thread about the 'downlink'
audio (from Base Station to subscriber equipment) containing
a bit of the 'uplink' audio.

Here is some background that I deduced reviewing the Ericsson
infrastructure equipment documentation (manuals, schematics, etc).

There is no provision in the BS (base station) or the MTSO (the
'switch') to transmit the mobile subscribers audio on the 'downlink'
path (the radio path from the cell site to the cellphone).

'Sidetone' is genned locally in the phone to the subscribers earpice. Now, when the cellphone's user's voice is heard it's because of poor landline 'return loss' - usually an analog POTS line with a mismatch (and POTS lines are always mismatched).

The cases where you CAN'T here the cell phone user's voice is usually when all digital trunks and PBX's are being used and an analog POTS line is not part of the picture. Like when you call the office and it's an all digital circuit and when you call home it's via a POTS line. Listen clsoely next time and see if this isn't true.

Hope this helps.

Regards, Jim. Recently took leave from AT&T Wireless Services

Special Event Station VG3W
Guelph ARC (Guelph, Ontario, Canada)

"In Flanders Fields the Poppies Blow" is the first line of the famous poem known worldwide by people of all ages.

From Nobember 4-11, 1996, the Guelph Amateur Radio Club will be operating Special Event Station VG3W from the McCrae House Museum, the birthplace of Col. John McCrae, M.D., the author of the poem.

This is the 81st Anniversary of Co. John McCrae, M.D., writing the poem in a bunker in Belgium during WW1. In Canada, Movember 11 is Remembrance Day, or Poppy Day. With the Special Event Station, the Guelph ARC is remembering the fallen and wounded of all wars who have made the world a better place to live.

VG3W will operate on all bands (2 meter packet, 6, 10, 15, 20, 40, 80) from 1500z-2200z.

I have bought, traded, and sold many scanners by using this newsgroup
without being ripped off! Get there phone number and call them to talk
it over. You can usally spot a con this way. I have sent money to people
before I got the scanner, I have also been sent scanners and then payed
when they arived. If you have any doubt then dont do it!

You have to use your judgement....dont trade with someone whos email
address is look@me.steal

There are a hell of alot of good folks out there who ARN'T looking to
rip you off.
But there are a few that are waiting for the chance!

I've found that especially in the Ham and Scanner groups, the sellers are
all very honest and have never had a lick of problems and I've bought lots
of stuff from the net.

Usually the stuff I do is COD, I've never purchased something using a credit
card but it would see that you would be even safer, as you have some sort of
legal recourse or way to dispute the charge is something goes wrong.

Okay, lets set the record straight.

NTSC is broadcast in a 6 MHz frequency band. The video carrier is 1.25
MHz above the base frequency. Channel 2, for example, has a frequency
band from 54 to 60 MHz, with the video carrier at 55.25 MHz. The video
is broadcast using Vestigial Sideband Transmission (VSB), which is
similiar to Amplitude Modulation (AM) except that part of the lower
side-band is "lopped off". There is only 1.25 MHz of side-band on the
lower side of the carrier but 4 MHz of side-band on the upper side.
This is done to reduce the bandwidth required by each channel.

The audio carrier is 4.5 MHz above the video carrier. For channel 2,
the audio carrier is at 59.75 MHz. The audio is broadcast using
Frequency Modulation (FM). The audio signal is usually broadcast using
a separate transmitter from the video signal because they require
different amounts of power to be transmitted a given distance.

The video signal, which is broadcast using the video carrier, has
several parts to it. It contains luminance information (which is used
by B/W and color televisions), and chromanance (color) information which
is used by color televisions. The luminance information is transmitted
as a base-band signal. The chromanance information is modulated on a
subcarrier within the video signal. For NTSC, the subcarrier frequency
is 3.579545 MHz. This frequency was chosen because when the chromanance

information is modulated on it, it "interleaves" with the base-band luminance signal. Actually the horizontal and vertical sync frequencies had to be "adjusted" in order for the interleaving to work. The vertical sync frequency isn't 60 Hz as many people believe, it is actually 59.94 Hz and the horizontal sync frequency isn't 15750 Hz, it's 15734 Hz (approx).

This is similiar to the way that stereo information is encoded within an FM radio broadcast. In FM broadcasts, the L+R signal is transmitted as a base-band signal (used by mono FM radios). The L-R (stereo) information is modulated on a 19 kHz "pilot" carrier. The pilot carrier is what tells your FM stereo radio to turn on the little "stereo" light and to demodulate the L-R signal so that you can listen to your favorite music in stereo. The audio information for television is modulated in a way that is very similar to that of FM radio broadcasts except that a 15 kHz "pilot" carrier is used instead of a 19 kHz one.

The NTSC chroma information consists of two signals named "I" and "Q". These signals are Quadrature Amplitude Modulated (QAM) on the color subcarrier. Inside the TV, the "I", "Q", and Luminance signals are combined in a matrix to create the Red, Green, and Blue that we are all accustomed to seeing.

I hope this sets the record straight.

Thanks.

Michael Mirabile

P.S. Closed Captioning information is encoded within the video signal. The first ten lines of video are not visible (if your TV is adjusted properly) and the Closed Captioning information is encoded on one of those lines. TeleText service is the same way.

Hmmm, Well let me double-check. I sure -thought- I had it all figured
out! Perhaps I got it just reversed...

All I really seem to recall is that the DB-9 to DB-9 required a null
modem (which I have been using up to now), and a standard DB-25 to DB-9
didn't. I'll post the results here soon.

Thanks for pointing this out. By the way, I'll try to get the
programming software uploaded to my Web site tonight (Wed.).

brpeter@ix.netcom.com wrote:

>Also, what is the cause of the cellular phone owner's audio not being
>heard?

In fact, the owner's audio should never be heard since it is not "directly" transmitted on the frequency you pick. It is a two-way link in a full-duplex fashion so, you need two channels: one for uplink and carrying the owner's audio (low power, short-range) and another for downlink coming from tower sites (high-power, longer range). You usually pick the downlink frequency and, therefore, "only" the far-end audio. Phone land lines usually suffer from a so-called "side-tone" effect: you may hear both channels mixed on the downlink because only one physical line is used and audio separation is not always perfect.

So, you might only expect to hear one audio on one channel, usually the downlink one, but an unwanted side-effect of the land lines mixes a portion of the uplink on the downlink. The amount of uplink mixed depends on the particular characteristics of the land line allocated for each conversation.
You will never hear the downlink mixed on an uplink channel.

Hope it helps.

Jordi.

I doubt it. How much do you know about the AR8000?

So what features does the 7100 have that the AR8000 doesn't? (ie. what
makes it better?)

Can the 7100 be computer controlled? Hooked up to a scout?
Does it have alphanumeric channel labelling?
Does it have onscreen menus?
Signal strength graph? Spectrum analysis?

It seems to me that the AR8000 outperforms the 7100 in these areas (and
probably more) so I'm wondering what redeeming features it has that make it
better than the AR8000?

I'm shopping for my first scanner and have some questions before I make a decision.

I am looking around the $150 - $250 range for mostly the home, but take it with me occasionally. The FAQ indicates that I will not go wrong with 800Mhz.

What are the pros/cons on portable vs mobile scanners. How does the reception compare between the two. It would make since that the mobile unit would get better reception because of the bigger antenna the the portable one.

I don't quite understand the reasons for different banks. I think you would put similar type of frequencies into the same bank (ex. Police in one bank, Aircraft in other...), but when you scan, do you scan just one bank or can you scan multiple banks???

Keypads??? Are they a necessity. One of the scanners I am looking at is the Sportscat SC150. It does not seem to have a keypad to directly key in the frequencies. Is this a pain???

I guess I am leaning towards the BC230XLT for now, but I have so much to learn before purchasing....

Thanks for any help.

OK.. a new one on me...
I have had a cb in my truck for many years. I'm somewhat new to sanning (about 7 months). When I got my BC220XLT I stopped listening to my cb and of course listened to my scanner. I bought a CD cassett tape thing so I could listen to my scanner through my sterio. I was using my cb antenna on my scanner untill I bought a RS glass mount scanner antenna. Now I have an ant. for each radio. Today I had them both on. I grabbed the cb mic and started to talk. To my surprize I heard myself through the scanner (sterio). Like I said "I'm new at this", but am I going to fry anything? Any suggestions?

Thanks
Kevin

> can't be as simple as connecting my scanner output to a cable.=20

I don't know what to tell you about plugging it into you LF door =
speaker. If you have
a cassette player in your car you can use a Radio Shack CD player =
adapter. It
is a cassette tape looking device with a wire coming out of it =
terminating in a
stereo plug. Pop in it the car tape player and stick the plug in your =
scanner.
All speakers work. With my Alinco DJ-580 I get 2meters in the left =
channel and 440
in the right. I have also used the Radio Shack Silent Play transmitter =
plugged into my
scanner. Transmits the scanner audio to a clear spot on the car's FM =
radio

The mobile scanner will typically have better 'insides' than a portable in the sense that the receiver's ability to reject unwanted signals will be improved. Also, mobile scanners will usually have a better audio amplifier due to the higher noise environment in an automobile.

>
> I don't quite understand the reasons for different banks. I think you would
> put similar type of frequencies into the same bank (ex. Police in one bank,
> Aircraft in other...), but when you scan, do you scan just one bank or can
> you scan multiple banks???

You are right. And yes, on most scanners, you can select multiple banks to scan or just scan one bank. For example, I like to monitor the local fire departments when I am at home, so I just scan that bank when I am doing other things. But when I am primarily listening to the scanner I will add in some of the other banks.

>
> Keypads??? Are they a necessity.

Keypads make entering frequencies a whole lot easier. For a first scanner, I think you would want a keypad.

For someone new to the hobby, I think a portable is a good choice, although a base scanner will offer more features and usually more 'bang for your buck'. If you really believe you will want to carry the scanner with you, go with the portable.

Hope this helps.

John

Yes, in fact you can use a splitter to send signal to more than one scanner. It helps if you are using 75 ohm feedline, and you will notice a 3.5 DB loss per drop but it does work. Most splitters have about a 20DB isolation between taps so interference from one scanner to the other should be minimal.

Motorola uses trade names to identify various features of their radio products.

"Private Line", or "PL" is their name for CTCSS (Continous Tone Coded Squelch System), where one of 38 standard 'sub-audible' (50-300 Hz) analog tones is mixed in as part of the audio on a FM transmission. It is used to open a selective decoder at the user's receiver, so the receiving party only listens to those users in the 'group'.

"Digital Private Line", or "DPL", is their name for CDCSS (Continous Digital Coded Squelch System), is a like operating system where a digital "word" is sent in the audio on an analog FM signal instead of the analog tone. There a numerous standard CDCSS 'words'.

Hope this helps!

Don

SOmething about it the whole story is just wrong. I mean, common sense would dictate that if you had a choice between a $150 cordless phone and a $20 phone with a cord on it, and wanted to make sure no one was listening in (at least as long as they haven't tapped the line itself), then the corded phone would be the way to go. After all, if the info was so sensitive that he now has to sell his house and spend money on a suit because people know this info, why was having a _cordless_ phone so important that it superseded all of that? =)

Hi David, I have both scanners and prefer the Bc3000 for scanning and
military listening. The Ar2700 has squelch sensitivity problems due to
it's method of squelch control. It will skip signals the Bc3000
receives. The ar2700 has many birdies. You should be able to find the
bc3000 for 300-320 mailorder new. Hope this helps, Mark.

I bought a 2006 from Ron Coursey in California. He's 100% on the up & up. <G>

This in no way vouches for the ethics of the others, Ron was great to deal with.

I'm not sure that I would agree with the argument listed below for
better unwanted signal rejection. Most mobiles that I have seen are
only double conversion. There are quite a few choices in the portable
realm that are triple conversion. Today's portables seem to be
where the manufacturers are putting their R&D making them with great
filters, audio quality and overall features.

The upper hand definitely goes to the mobile for audio volume(and
sometimes audio quality). If you can be bothered by a cassette
adapter, this point too might be mute.

If you find yourself in your car a LOT, then the mobile is the
way to go. If you find yourself listening when walking around,
in the car and at home(and can only afford one or two radios),
then a portable with the cassette adapter is the way to go...IMHO.

Strong signals,
Rich Wells

Some of that "noise" may be from the transmitter "choke" filter not working correctly. This background noise is usually filtered out and you, or the officers, would not normally hear it. Being "off Frequency" doesn't sound like the cause, at least to me.

Hope this helps.

I own a 2700, don't get it. It's trash. Birdies galore, terrible
sensitivity, picks up all kinds of garbage. The only good thing is
800MHz. MilAir is deaf as well.

>transmissions I sometimes switch the meter to show "center." On
>transmitters which I know to be dead on frequency, the meter shows the
>frequency is on the low side. Is there a way to calibrate the receiver
>so that it will be back on frequency?

It is very common for older R7000s to require
realignment of the crystal reference oscillator
in the PLL section. The crystal ages with time.
The higher in frequency you tune, the
more noticeably off frequency the R7000 becomes,
as revealed by the center-reading meter, especially in
the 860+ MHz range.

I've realigned a few R7000s, including one I used to own.
Sorry, I no longer have a service manual for the R7000
so I cannot cite the exact component nomenclature.

The realignment requires the proper non-metallic
alignment tool to adjustment a core in a coil.
It is located within a shielded compartment on
the side of the radio.

You must remove both top and bottom covers of the R7000.
Then, you must remove the metal shield cover.
Let the radio warm up.

Sorry, I cannot be more specific without having it
in front of me. Perhaps someone with a manual
can point you at the exact coil location.

The Icom schematic does not portray the
coil as having an adjustable core, but it does.

Not a scanner, but between 1988-92, I bought and sold a great deal of computer equipment (most Commodore 64/128 stuff) and never once did I not get the equipment (if I was buying) and only once did I lose out when I was selling (but it was only 5 dollars out of about 50). The best approach to buying that I have seen is to have the seller send the item COD. That way, you should be able to inspect it at the Post Office before paying for it. If you reject it, you keep your money, and the seller keeps his scanner.

If you can have them for roughtly the same price then you should
definitely opt for the 3000. All that you are really giving up
is a computer interface capability(if you're new to scanning
I wouldn't worry about this) and access to frequencies below
25 MHz(which scanners aren't really designed to pick-up anyways).
The 3000 has a lot more features and is definitely more "usable".
You won't regret buying the 3000 and it should serve you for
years to come.

Strong signals,

I think this is the model that can support up to 3 handheld units off of
one base. Supports paging and call transfer between handsets. 900
spread spectum.

>had a flight number of 082, not 6718.

Very high flight numbers generally indicate a subsidiary
airline or a flight operated under contract for another
airline. USAir flies into several U.S. cities as an
extension of British Airways. I don't have the flight
numbering information available at the moment. I doubt they
identify as SPEEDBIRD, though. It's probably a 4-digit
USAir flight number.

Did you check (if it was possible) for any BA6718 to see if
it was a different route?

Radio Shack scanners, 800mhz or 1.3 ghz style are available. depends what bands you are going to listen to. They are made by Uniden , but designed just a little different, I think the rec. is better that any of the Uniden scanners that are made. Even if it is still made by Uniden.

Have a near mint AR-950 mobile/base unit for trade. It is 100 channels; 12 volt operation; coverage as follows: 26 - 54mhz; 108 - 136mhz; 137 - 174mhz; 406 - 470mhz; 471 - 512mhz; 830 - 869mhz; 870 - 890mhz; 891 - 950 mhz. The correct .030 spacing is intact. I have the original box, the wall adaptor and a BNC antenna, mounting bracket for mobile use Manual is lost. I would like to trade for a different scanner, preferably a handheld unit in this trade. I am partial to Realistic brand units. Consider a Pro-39, Pro-46, Pro-25 or what have you to ofer. Please E-mail me if interested.

I think it would be easier to simply build (or buy) a circuit for the scanner that directly activates the recorder. (Unless you absolutely need the computer to get involved for logging purposes, etc.) Using a program would require that the scanner "talk" to the computer to tell it when it was receiving a signal. The computer would then interpret the info and turn on a switch that would turn on the recorder.

I would be better to have the scanner "talk" directly to the switch...bypassing the computer altogether. Fewer parts, less complicated. What kind of scanner are you using?

Andy

Many use the "auto-start" function on tape recorders to provide this function.

And Olympus has a great little unit that also time/date stamps each recording.

Bill Cheek has an easy-to-build plan, I believe, that will flip a relay when incoming audio is picked up.

>But as long as they feel good and confiscate YOUR assets to give to
>society's sorry and ignorant deadbeats, that's all that counts.

That's what this is really all about isn't it- greed? Believe me,
entitlements and social programs are not even the primary reason I'm a
Clinton supporter.
>

>These people just make me want to heave my guts out everytime
>they type something. It all sounds exactly the same. Different keyboard,
>but it all comes out of the exact same book of liberal/Marxist crap!!!

I disagree with what both of you are saying, but it really doesn't make me want to "heave my guts out." I marvel at your beliefs and try to offer a rational opposing view point, but I don't go around claiming to be intellectually or morally superior to you, or claiming that you make me physically ill. I think that's called tolerance. You and many other Republicans could use a healthy dose of it in my opinion.

3356. WTB: Realistic "PATROLMAN" Transistor Portable Radio

Newsgroup: rec.radio.scanner

Cross-posted to: rec.antiques.radio+phono,rec.radio.swap,rec.radio.scanner,alt.radio.scanner

I am interested in purchasing a near-mint to mint, looking and function, Realistic "Patrolman" Transistor Radio. Unit Would bear the model number of 12-627. It covers AM as well as 147mc - 174(or 175)mc police/public service band. Tuning achieved via thumbwheel style. The unit was popular in late 1969 - 1970 era. I may also have interest to a lesser degree in either of the following units:
Model 12-628 / Same as above but the LOW VHF police/public service.
Model 12-626 / "AIRSTREAM", As above but AM/ & 108-135mc aircraft.
All three units looked the same, except for the markings to indicate their reception areas.
Please E-mail with your information on the 12-627, or either of the two other units. Need to be near mint to mint. Please give asking price with your e-mail to me at radioman@localnet.com. Thanks you for your interest.
Regards

It's totally non-criminal to modify a scanner to receive on frequencies
which are used by cellular phones. Why else do companies openly
advertise they will do it (and some have done so for years)? It's only
illegal to actually use it listen in on private conversations (in the
US). In Canada, you can listen to what you want as long as you keep it
to yourself.

3364. Window's DTMF decoding software available

Hi,

Please check out my window's DTMF decoding software at:

http://home.aol.com/pdrunen

If you can not connect to the site, please reply with e-mail address and I will upload it to you!

PDRUNEN@aol.com

DTMF stands for Dual Tone Mult-Frequency and they are the tones you hear when you dial on a telephone. These analog signals are turned into binary signals a computer can understand and displayed on the computer screen.

This is to all you morons that went out of their way to trash the R-7100 Receiver that is for sale. 1st: you hacks have no brains. If ICOM radio's are so poor, why is it that almost every federal agency interested in monitoring communications choose ICOM radio receivers ie: R-9000/7000/7100 for their needs? Maybe because they're GOOD next to Watkins-Johnson, which run at a price of around $40,000 a pop , and they are proven radios. Here is some advive for you little 11 meter whiners: Keep looking for your local Police on your AM radio.

It isn't a crime to MODIFY a scanner to monitor cell phone freqs. It IS a crime to MONITOR the cell phone freqs.

Or...were you wondering if criminals modified their radios in a different manner than non-criminals? (grin)

The mod depends on the radio...some are hard, some are simple, some are not able to be modified. What radio do you have in mind?

Hi everybody

I have the opportunity to buy either a BC-3000XLT or a AOR2700 for roughly the same price. With relatively limited knowledge, I revised the technical specs. and concluded that AOR2700 would be superior, but browsing some web pages, I found some negative comments about it.

I'd like to know if anyone out there could give me some advice on what the better choice would be. (Although I am no scanner pro, I'm not particularly worried about the complexity of operation or programming of any of them.)

Thanks a lot!

It took me about 3 months also... So, have fun waiting!

By the way... I have been a GMRS op for about 2 years now and I think I have spoken to 1 person sofar on the systems out here. Three times now I have been on the system during a net. They ask me my number so that they will call me and tell me how to become a user on the system. Well, they say "We will call you in about 1 hour..." NOTHING! They, never call me back.... I don't know if you know what its like but, people won't talk to you unless you have a UNIT number assigned by the PREZ of the repeater. It's kinda a group thing...

Don't get me wrong... I love GMRS it's quiet and peaceful but, need more people to talk with on it.

Anyways, have fun and hopefully your GMRS users and ops are more reliable out your ways.

Time to just hang out on the HAM BANDS more...

That would have been a great idea (what is it they say about hindsight?). I even have a machine set up with a feed so I could have done it easily. I guess I was so caught up in trying to get all the different scanners on the right freq's...VSP would have been the one to get!

A couple people of sent me mail asking what P-MARS is...It is the police mutual aid frequency. In my area this is 453.55. There is also a fire mutual aid on 154.28 and I believe a nationwide mutual aid used on 155.475. I keep them programmed in my main bank although they are usually quiet...but when something big happens (like this) and it crosses many jurisdictions the channel will become active and you can get a lot of info.

Good scanning...73

From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <3281E255.167E@vnet.ibm.com>
Source record: 218315

The 7100 definitely does not have the features or flexibility of the 8000. What it does have is a better receiver. For the difference in cost between the two, most people would, and should, opt for the 8000. If you are looking for the best in performance, rather than all the "gizmos", then the 7100/7200 is the way to go. I personally use my 7100 much more than my 8000; but the 8000 still amazes me for all that it does...

Message-ID: <3283BECB.3E59@col.hp.com>
Source record: 218070

As promised, I have added the original Uniden MR-8100 programming software, SCAN.EXE, (with permission from Uniden America), along with the newest version (0.9) of the Windows-based programming front-end, PSCAN, to my Web site as downloadable files. SCAN.EXE is not too large, but PSCAN is 700K and will take a bit of time. PSCAN is also available from the HamNet Forum on Compuserve and the Ham Radio User Group on AOL. Both programs are required.

http://ourworld.compuserve.com/homepages/Scan_PikesPeak

Those of you who have acquired this scanner, but are without the programming software, will find this indispensible.

Regards, Ken

Kirk,
The most practical splitter for scanners are TV coaxial 75 splitters. If you don't live in an area where there's alot of RF you can put a broadband preamp in front of it. Remember, preamps make nice mixers when they're overloaded so don't expect miricles if the CB'er next door hoses it down when he's on the air.

Yes. Here in the Toronto area they are starting to market such a device.
It can be a cellular phone, two-way radio, and a pager. I'm not exactly
sure of all the details at this time.

Not unless it is capable of playing back NTSC tapes (there are some multi-standard VCR's but they tend to be pricey) as your normal standard in the UK is some form of PAL.

While this whole thing is getting quite off the scanner subject, I would like to ask something that I have asked/commented on before. Why do people assume that sending something by e-mail means that the addressee is supposed to keep it private? Especially if, such as the apparent situation above, there is a dispute about what someone is saying to strangers outside of the newsgroup and what they say here in a "public" forum.

Addressing the above - if you have something that shows malex007 is talking out of both sides of his face, by all means share it! THAT IS - if you think that it would benefit the newsgroup.

For the record... Anyone that sends me an e-mail is taking their chances. I don't make a habit of reposting e-mail messages from my inbox to newsgroups - but there is nothing that says I can't. I keep personal and business/legal matters appropriatly confidential. But when I take issues from a newsgroup to private e-mail it is usually because I think what I have to say will not benefit anyone else. If that recipient wants to resend my e-mail back out to the world with comment there is not much I can do about it - but in that case don't blame ME for wasting space on your news reader.

The point is... when you send e-mail to someone you don't know, what makes anyone think that it is magically considered confidential?

... and this newsgroup is home to the same group of people that think the public is dumb to expect privacy on a cellphone?

Regards

I'm new to scanners and am looking to purchase my first. While shopping around and trying scanners tonight, I discovered something: Scanners that have air band don't necessarily receive air transmissions. The scanners need to have AM/FM capabilities, too. As I'm looking for a handheld, this pretty much turned me off from the BC220 and SC150. I am now looking at the RS Pro-62. Tried it out tonight at the store and was able to receive air transmissions, unlike the sportcat.

Anyways, before I spend $200 on the Pro-62 (on sale), does anyone have any experience with this radio, or have you heard anything about it?

The 800 band seems pretty split up (looking at the manual). Is there any way to restore continuous 800 band to this radio?

Thanks much.

Correct me if I'm wrong but I think you're both right. The 1986
reference is to EPCA which only covers cellular, thus cordless is
still covered by the 1934 (?) communications act.

Thus one can legally listen to anything they want around 46 MHz
(cordless phones) but they can't tell anybody what they heard.

But one is breaking the law if they even listen to anything up
around 900 MHz (cellular phones).

IMHO it's a bunch of hooey. There should be a law against
unenforceable laws... but then it'd probably be one. ;-)

From: Morgoth Bauglir <Melkor@usa.net>
Message-ID: <32841315.3A4D@usa.net>
Source record: 218090

I've been looking in here periodically, but haven't spotted a faq floating by...

I'm looking for the frequency of the Lakewood, CA LA County sheriff's substation (including the helicopter) and a portable receiver capable of picking it up.

I've had some Bearcat's in the past, but getting 'em fixed and/or replacing the batteries has been a problem (or expensive). I also don't want to deal with a display that only shows one digit of the frequency at a time - I want the whole frequency to show.

How much should I expect to spend with these as minimum requirements? What should I look at, and where?

And *is* there a faq on a web site with all of this stuff already collected?

TIA

Melkor

Please Mr.Ort, you know as well as I do that this is a total load of crap!!
I was the one that started the ball rolling with an innocent thread on Compuserve in regards to the "problems" with your mailing schedule. Seems many, many more people were experiencing these same problems as well as others. Calling the number listed in the front of the mag was of no use due to total rudeness on the part of your telephone staff. After many months of blaming everybody else for your problems it was realized that most of the problems were internal and nobody cared to pay attention to them for a long long time. I'll have to admit that the problems were eventually fixed but I still decided not to renew my subscription due to the fact that nothing was ever mentioned in the magazine about the problem. This total disregard for the subscriber was, in my opinion, unforgivable. It is time to own up to your mistakes and stop blaming anybody and everybody for the magazines problems!!!!

Additionally, I did keep all of the e-mail from Rich M., your Compuserve online rep and can show you the pattern of excuses all the way up to the time some responsibility was taken for the problem. Ultimately, I received a letter from your publisher as a form of a "Thank You" an apology and a promise things would be taken care of with the mag in the future. Still, not a word was ever seen in print alluding to any of this.

Sincerely,
J. T. Makatura

>
> BTW: Most in-car video systems work on regular wireless mike freqs from
> 169 to 172 MHZ.

Problem is, this can work both ways...

Not all cops know to turn off the wireless mics as they're out of a danger zone, and sometimes the cops have a tendency to make 'politically incorrect' (albeit accurate) comments about the people they've just dealt with. Citizens & the media could be listening to what the cops think is just a private, unofficial conversation at that point...

A more acute situation is that someone could very easily create some big problems for the community government by transmitting on the car-video system's audio transmitter frequency & 'interjecting' some comments at the right time in a voice similar to the officer's. No one would hear it (unless there was someone in the area with those freqs in a scanner -- again, the media or...), but if there were ever some reason for a command officer to audit the video tape (& someone could always call-in an anonymous tip to the police/media), the officer/department could get into trouble for something that in reality a prankster or person with a serious grudge against the department did!

It sure doesn't take much for some savages to start rioting & looting, and it isn't like they'd wait to learn what the outcome of the official investigation as to whether Officer Jones really said "OK you dumb ____ (nigger, honky, or whatever...), let me see your driver's license now!" or if technical analysis of the recording indicates someone else said it.

>"illegally"? Police agencies can use almost any frequency
>they want, without a license, if they run very low power.
>It's in the FCC regs.

Admittedly, my copy is a few years old but 47CFR90.19(g)(3) says the
frequencies listed in paragraph (d) are available for low-power use.
Only those between 40 MHz and 952 MHz. The maximum power is 2 watts.
So the 100-watt mobiles are not legal. Neither are the frequencies
normally not for police use. And it requires the users to identify.

Needless to say, Dallas is not the only PD that doesn't abide by the
rules.

>net. Your radio may need repairs other than alignment.

I was given some basic information on what I have to do but nothing
concrete. I need a service manual to do the job. The person told me
that it is quite common for the R-7000 to develop this problem. So far,
performance has not noticeable suffered but I suppose that eventually it
will.

Since you live in Canada, it is legal to listen to cell phones (but no to disclose anything you hear.) RadioShack only gets U.S. import scanners, so they are cell blocked by law. I just bought an AOR AR2700 which was imported from Japan, where it is made, and not the US. It has no cell blocks at all, only the models going to the US do.

Message-ID: <19961108055901.AAA19598@ladder01.news.aol.com>
Source record: 218193

Yes Mike, there are scanners out there that have the option of being able to descramble scrambled telphone conversations via a plug in board. The first one that comes to mind are AOR's offerings.

There is also a Ramsey product/kit that will do the same for any scanner's audio output.

Cost? You shouldn't spend over $70 to do this little feat.

Or, if you already have a telephone that has scrambling......hehe...

and have two scanners......

then:

Scrambled Cordless Telephone Descrambling Instructions
by bluedot9@aol.com (Dave) Copyright (c) 1996 Blue Dot Technologies

Items needed:

2 scanners
1 cordless telephone with scrambling technology
1 fool that will broadcast scrambled conversations for you to receive

1. Get Scanner#1 (referred to as S1) and put it on the freq. on which scrambled conversations are happening.

2. Put your telephone (T1) on intercom, dial a loop, unplug it from telco jack. or something to prevent *any* noise on the telephone.

3. Place the mouthpiece of your scrambled (T1) next to the speaker of S1. Try to get a really tight input on your phone--to resemble as if they were actually talking scrambled babble into your phone! This makes a difference...trust me.

4. Tune Scanner#2 (S2) to the freq. of your own scrambled telephone. Preferrebly in another room to prevent a feedback loop, plus the inverted signal will work against the regular signal and will play hell on your brain when trying to comprehend!

5. Listen to your heart's content. It may be slightly awkward to listen to this type of setup, but you can actually make the words out.....much better than it being scrambled.

Yes, I know that it could be cheaper to buy a descrambler, but if you have the goods, then see if this works for you. When you decide that it *is* worthwhile to buy the descrambler....then do so....or

If you have a scrambled phone alone, try step #2 and then change channels to see if you can pick up their freq. Tap on the receiver a couple of times to make sure that the other party cannot hear you. Enjoy!

Dave

The minimum bend radius should be _no less_ than 2-1/2 times the diameter of the cable, according to the methods we used on sub construction. I think 9913 is .405" in diameter, so that would be 1.01" minimum BR. For me, that's too tight. I generally double that just to be safe.

Looking for advice on a unobtrusive, full-range (30-1000 MHz) scanning antenna. Due to restrictions in my development, I'd like to stay away from a discone because of their visibility.

The antenna will be mounted in the clear approx. 25' from the ground. I'm currently using a low price RS antenna (cat #20-176).

One antenna I'm considering is the RS All-Band Ground Plane (cat #20-014).

Here's my last word on this subject. You've got the audacity to accuse me of hypocrisy, while at the very same time you are engaging in extraordinary cowardice and vindictiveness. You and the other jackels that you refer to don't have the spine or decency to say to Durigan that his overtly racist comments are objectionable and intolerable. Instead, you seize upon my sardonic "red-necked-one" comment as some sort evidence of hypocrisy on my part. The truth is that the three of you have your own private agendas that have nothing to do with Durigan or his racism. Indeed, you silence on that subject is quite telling. No, you are the hyocrites. You are also blackguards, liars and cowards.

It should be mandatory for folks who post to this NG to read a few articles before posting. You all know what I mean. For example;

1. "What are the cordless phone frequencies?" (I just bought a scanner and I figured you guys would help me listen to my neighbors).

2. "How do I receive cellular phone calls?" (See number 1).

3. "Please provide me with all of the police frequencies." (I'm too busy to research this myself, you fellas seem to have a lot of time on your hands).

4. "Please email your response to me" (See number 3).

5. {After a complete repost of a 16K original article}"...I agree..."

6. "You misspelled 'frequency' three times..."

7. {Although I never read these} "You're a poopyhead", "Mackey...", "Cheek...", et al.

Sorry for this quasi-non-scanner post. I just needed to get it off my chest.

Pardon me, Michael, but read who wrote what. That is not my comment. I believe Tyler made that one...

> The truth is that the three of you have your own
> private agendas that have nothing to do with Durigan or his racism.

No, it is a very public agenda. It is to show you that even you do not live up to your own standards, which you expressed to each of us during the cheek/mackey flame wars. You're right, we don't give a hoot about Durigan.

> Indeed, you silence on that subject is quite telling. No, you are the
> hyocrites. You are also blackguards, liars and cowards.

Silence? Shall I make our private e-mail public? I told you what I think of Durigan there, and you responded with further accusations, foul language and further insults.... By the way, I will make one of my comments to you public (which is my right). Please stop sending me foul languaged, insulting e-mail. If it continues, I will forward them to abuse@aol.com aned abuse@kersur.net. That, Michael, is what started this in the first place, not any "loyalty" that we have toward Durigan.

Grow up, Michael.

Can someone please tell me if I am using the proper procedure for programming a 2022.

A friend gave me his unit to put a battery in. He said he hasn't used it in a while.

I put a new battery in it and tried to program in a freq. I used the following procedure.

I pushed "1" "Manual" to get it to channel 1.
I then pushed "Program" 162.55" "Enter"

The displayed added the appropriate number of zeros and it looked like the freq was programmed. BUT, I got nothing out of the speaker other than static. I then tried programming channel 2 using the same method. When I went back to channel one, the frequency was not there.

Am I doing something wrong in the programming procedure?
Is there a way to reset the unit (I already pushed the reset on the back of the unit)?
Does it sound like there could be something wrong with the scanner?

Thanks in advance for any help.

Unless they're using ham, marine or aircraft frequencies
without a license, or running more than portable power on
any other frequency, how can they be using frequencies
"illegally"? Police agencies can use almost any frequency
they want, without a license, if they run very low power.
It's in the FCC regs.

> Happy Scanning, Bill

Bill,

I had a mobile scanner at one time. The problem with a mobile is that you can't take it with you if you leave the auto. I finally got a single handheld and auto-antennas for both of my vehicles. In my main vehicle I installed a Radio Shack amplified speaker and in my second vehicle I use a Sony cassette adapter to listen to my scanner through the stereo.

I don't know exactly what your needs are, but I thought I might share my experiences with you.

>it be a coincedence????

Sounds like the "Front End" has gone. OR it could be a broken aerial connection inside the radio. (assuming that you can hear hissing sounds when you defeat the squelch)

I doubt that you have overloaded the front end just because you used the CB aerial. As long as you are not too close to a high powered transmitter OR that you did not have the CB rig hooked into it as well.

If you did, well ....Pow, there goes another front end!

A lot of radios have fairly good tollerance against moderate overload. Some have diodes across the aerial input specifically to shunt higher rf voltages down to ground before the rise to a damaging level. I'm not sure if yours have diode protection.

Static electricity build up could cause the front end to go. A jolly good thunder storm in the area could create many hunderds of volts across the aerial terminals (Even without a direct lightning strike)

If it had been a direct ligtning strike,the radio would be rather cooked to a crisp! all black and 'orible...

Static electricity can also be build up in the body, especially on a hot dry day. This is exaserbated if you are wearing rubber shoes and walking over synthetic carpets - you could have a static charge developing many thousands of volts 50,000 is quite common (Ever had a zap from a car on a hot day? Thats about 75,000 volts!)

As your body static builds up, it can be discharged through the radio as you plug in the aerial OR even by just touching it.(In the latter, case though the radio will probably be safe beacuse the discharge path is via the earth/screening . BUT electricity always takes the line of least resistance so beware. If you suspect that you have high body static, lick your finger and touch an earthed conductor such as a central heating radiator.

However, all this may be after the horse has bolted. I suggest that you take the radio back to the store where you bought it from and get them to check it out for you...

Hey Radioman

As a newcomer to these groups, perhaps you are not aware that it is very much frowned upon to post binries in newsgroups.

I and thousands of other folk just got (for the second time) 17,000 lines of your wav file that I consider as "junk mail" (I wonder how many computers crashed with "Out of disk space" error whilst trying to download it.)

Do think about it, that not everybody wants to receive huge postings and that by thrusting it upon everyone, It is not doing your reputation much good.

If you want to get the answer to the question, I suggest that you ask it in a similar way BUT not add the wav as an attecment. In you request for help, suggest that if anyone can help, then you could EMAIL the binary to them.

Consider, if you will, thousands of folk have to pay their telephone company for each second of the call into internet, even if it is a local call. (That is not the cost of Internet here, just the cost of the phone call on top of the internet charges!)

Even with a 28.800 baud link, it took time. I wonder what people with much slower modems thought of you efforts!

Please think twice before inflicting binaries on anyone... Thanks

>to do it?

I sell products on Internet and I have bought products via Internet.

Personally I will not give a credit card nunber out to anyone other
than a regular store/shop/or company that I know of. That is my only
reservation. I certainly would not give the number out to an
individual on a caual contact. (whether that contact is via Internet
or otherwise.)

I have sent cheques and received goodies with no problems at all.
Likewise, people who buy from me have been reliable, I have not had
payment spoiled in anyway whatsoever.

There must be a certain amount of trust on both sides of the deal.

As a seller on Internet, I am very aware that if I were to give a poor
deal to anyone, then that person can pop up in the newsgroups and
slander me left, right and centre so much so that it would curtail my
operation very smartly. I think that the vast majority of 'net sellers
have this very much in mind. Reputation is everything - it only takes
one deal to go sour and that's it!!!!

All this said, there are bad deals out there and a certain amount of
caution or care should be given before parting with money. Buyer
beware!

If you see the guy or seller regularly making postings in a group and
he is a well established "personality" there, then I would tend to
think that it is a safe bet.

Advice over - Now a word from our sponsers....

>Mike

Hello Mike

Can't help on the definitive rad but...

My personal rule of thumb is that the minimun radius of a bend in coax is when there is likely to be a crushing or collapsing of the screen conductor distorting the "circular" profile.

All this being said, if the coax is for receiving only with no "power" from a transmitter going through, it a slight kink will more than likely not uset the receiving capability as a whole.

The other mechanical aspect that I pay attention to is the water/weather proofing of outside exposed connections. Any rain or dampness that can get into the coax can eventually cause problems with corrosion. More importantly, in the winter, rain and moisture in exposed fittings and coax can freeze. As we all know, when water freezez it expands. This expansion can break open the metal fittings.connections. It can also cause the outer sheath of the coax to split. This split will then let in even more water next time it defrosts and has rain on it.

TIP: if you suspect water in the coax, take the lowest bit of coax that is inside, out of the weathern and carefully cut a nick in the outer sheath and put a bucket underneath to catch the water. It is amazing the amount and pressure that can be built up in a 150 foot coax full!!! (If it is below freezing, then it won't drain until it defrosts!)

I own several towers in excess of 100 feet high. This is a very real problem, so all fittings get a coat of waxed woven fabric tape.

In the UK it is called "Densil" tape (i think that is the correct spelling) and you can get it from good electrical wholesale shops. It is a very thick waxy grease bandage that if 'orrible to handle but keeps all the weather's grot out of the works. (Your hands soon clean up with liquid parafin (kerosine) though.)

It IS worthwhile doing if the aerial and connections are in a location where it is expensive to get to! (Professional aerial riggers can cost a lot - for safety, they have to work in pairs, so that's two blokes wages per hour!!!!) (I have insurance that limits my engineers to 50 feet without excess premiums!)

One other thing I suggest is giving every metal part that is not stainless steel, two to three good coats of polyeurathane (sp?) varnish before it goes up. I did that on an aluminium 19 element VHF beam aerial 15 years ago, last month I inspected it and it is still as good as new with shiny alluminium underneath with no signs of ally oxide! On the other hand, I inspected a UHF beam that had been put up 5 years ago with no protection or attention to the weather proofing. It was severly corroded to the point of distruction. I had to drive 300 miles round trip to get a new one and it cost over 120 pounds. Had the person who installed it in the first place spent about 2 pounds on weatherproofing, the original could have lasted 20 years plus!

Hope this helps...

>>> I need a recording program who start recording only when he receive
>>> something on my scanner. Thanks for your help.

>Many use the "auto-start" function on tape recorders to provide this
>function.

Here in the UK you can buy a gadget called SOCS.

Made by Seldec, it is a Signal Operated Cassette Switch that will
start the motor of any cassette recorder that has a ON/OFF jack.

It sell for only a few pounds but is real value for money. It has
quite a sophisticated circuitary that operates on audio rather than rf
activation. This means that it will not react to a transmission that
is just a carrier with no audio. There is a volume control for
recording levels and a delay control for the tailgate of
transmissions. operates with internal batteries or takes external
power source...

Check any of the main line Radio suppliers in the UK,. Most of them
will export to you.

BTW: I don't know if they are still available, but I can recommend the
REALISTIC VSC-2000 Cassette recorder

It is special because it has a built in Variable Speech Control. You
can record normally, but when you play back, you can either have
normal play back as in conventional recorders or you can increase the
speed of playback up to 100 percent faster (a 30 minute recording
played back in 15 minutes)

Ther is a variable pitch control the readjusts the high pitched rapid
speech back down to the normal level. It realy does work fine.

I haven't seen one for sale in a shop, but may be available from
sources that specialise in supplying equipment to partially sighted or
blind people. That is where ours came from. It is primarily used as a
learning aid or for cassette books. It takes regular cassettes.

The SOCS combined with a variable speech control is magic!

3461. AR2700 Service Manual and "EEB"?!

Newsgroup: rec.radio.scanner
Date: 1996-11-09 00:00:00 UTC
From: dmitton@mulberry.com
Message-ID: <562q1i$pa6$1@gollum.kingston.net>
Source record: 218024

I'm looking to purchase an AR2700 service manual, I've seen postings
that there are available (?) from "EEB".

1) What is "EEB"???

2) Does the Service Manual have an ISBN number or the like?

Thanks in advance!

3462. Now Working: AR2700 and Home Made PC I/F!!!

Newsgroup: rec.radio.scanner
Date: 1996-11-09 00:00:00 UTC
From: dmitton@mulberry.com
Message-ID: <562gcdmrk1@gollum.kingston.net>
Source record: 218025

I want to thank all the posters here and in EMail who had comments and information on getting my interface up and running!

It turned out my problems involved 2 things:
- My AR2700 didn't like the approximated voltages in the "zener diode" or "two transistor" level translator circuits ... I had to use the MAXIM based circuit.
- Most terminal programs don't provide a proper CR/LF pair without actually using the ENTER key then CTRL-ENTER. I fixed this by removing the LF option from the AR2700 serial menu setup.
(Thanks to Ray Linton linton@mhv.net for this tidbit.)

This is not to say these won't work for you BUT they didn't work for me. To help anyone else contemplating doing this, here is an outline of what I did.

"This is not for the Electronic Faint of Heart ... this info is for reference only, not to be used as an instruction manual!!!"

1) Installed the Scout Port Mod
- I used the instructions located at
http://www.mv.com/users.wje/jack_howto.html
- Also used some great email ASCII art from
csmith1@CCGATE.HAC.COM (Thanks)
- Remember ... measure thrice, cut once!!!
2) I continuity checked the connections with a BLANK 3.5mm jack plugged into the port before re-assembling ... only the proper connections, no shorts. Use the "diode" low current option only please ... don't want to destroy that AR2700!!!
3) Constructed the level translator PC interface
- Based my circuit on:
http://www.primenet.com/~baron/aorintfc.html
I couldn't get a MAX232 chip, only a MAX235 which is the same thing only bigger (more ins and outs) and the capacitors are built in.
- The MAXIM data sheets and stuff can be found at:
http://www.maxim-ic.com/
- Once I made sure it was working I mounted it in a Radio S. project box with a 5 volt regulator so I can power it from a wall adapter ... I made a "Y" cable so that the same one can power the AR2700 and the Interface. Also added a "Power ON" LED just for convenience.
4) Used the terminal parameters supplied by 1 above ...
9600 baud, 8 bits, No Parity, 2 stop bits
I used Telix actually and "AT1<Enter><CntlEnter>" caused the AT

(attenuator) indicator to light, so I knew I had it!
"AT0<Enter><CntlEnter>" turns it off again.
- To stop using the "Enter" then "Cntl-Enter" stuff I removed the
AR2700 serial port option "LF". Now "Enter" alone works!
5) The command reference at:
http://www.mv.com/users/wje/cc-2700.html
is a must!!!

I'm not saying that anyone should do this, I am just documenting what I found in case someone should have similar problems. My main reasons for doing this are 1) interest and 2) economic. I saw that actual AOR interface package last weekend in Bytown Marine in Ottawa, Ont for $38x.xx Canadian ... my home made one cost aprox. $20 Canadian and I don't have to remove the batteries to use it.

Now, if I could just get into the scancat site ... seems to be VERY BUSY! Thanks again to everyone!!!

I guess you can say the same thing for the guns and ammo these scumbag's use and where they come from. We could argue about this for time immemorial.. My point was simply this: the fools that go out of their way to discredit a radiothat is FS by saying it's trash , when it has a well established proven track record is stupid. If one is not interested in an item that is forsale, go then, to the next listing.

Thanks for the reply

A pretty good explanation... depending on the manufacturer of the
equipmant, ctcss (continuous tone coded squelch system - or something
like that) is aka P.L. Private Line, Channel Guard, and various others.

As I understand it, DPL is simply a digital coded PL, rather than a
sub-audible tone.

3473. BNC connector problem

Newsgroup: rec.radio.scanner
Date: 1996-11-09 00:00:00 UTC
From: Jerry <jps@pacbell.net>
Message-ID: <32857D38.1570@pacbell.net>
Source record: 218036

I have a Uniden BC80XLT handheld scanner. Recently I noticed it seemed to stop working; when I moved the antenna (I use a ducky as well as a RS whip) it started working again.

It appears that the two metal contacts in the female BNC connector had simply gotten loose. When I pushed them toward the center, the scanner began to work fine again.

Is this a common problem or might it be due to the fact that I am using the RS antenna which, since it is longer and heavier, puts more stress on the connector?

Thanks

3474. Re: Cell Phones Unwanted in Wilderness

Newsgroup: rec.radio.scanner
Date: 1996-11-09 00:00:00 UTC

Message-ID: <19961109170400.MAA17946@ladder01.news.aol.com>
Source record: 218037

RFWS Fact Sheet #102

What is the Radio Free Wilderness Society?

The Radio Free Wilderness Society was formed to defend the backcountry environment from being destroyed by modern radio technology. In particular, the society fights against the use of portable cellular telephones and other wireless communications devices in wilderness areas.

Isn't this a restriction on individual freedom?

Yes, but so are other laws. In this case, the need to defend wilderness and reduce the number of wireless-induced emergencies overrides the need to place telephone calls from the backcountry. No one really needs a telephone in the wilderness.

Are you guys for real?

Yes, very much so. Our group includes people with a variety of backgrounds: environmentalists, lobbyists, telecommunications engineers and electronics engineers. We have the knowledge, ability, motivation and technical skill to accomplish our goals.

Is it true you plan to interfere with cellular sites?

This is only one possible action that could be used. Our main efforts will be aimed at public awareness of the issues, new legislation and other non-technical solutions. However, jamming of cell sites could be easily accomplished with available technology. It would only be appropriate and necessary to jam sites that have coverage in backcountry areas.

Won't you cause injury to innocent parties if an emergency phone call is jammed?

In the short run this could happen. But as people realize that cellphones are not a substitute for being properly prepared in the backcountry, the overall safety situation in the backcountry will be improved. And, again, interference will cell sites is a last resort to achieve these goals.

Existing cellular phones are one thing but what about Motorola's satellite-based system (Iridium) that will cover the entire earth?

All the more reason to reach a legislative solution. Existing cellular coverage is a small but fast-growing problem in the backcountry. When satellite-based systems come on line, wilderness as we know it will be gone forever. We must act now!

Do you have a contact person for more information?

At the moment, the society has chosen to remain anonymous due to the potential political problems that could occur. For the same reason, we are not soliciting new members at this time. The federal government has been known to take action against free-thinking organizations like ours. (The RFWS has not violated any federal, state or local laws.)

Scanners that have 108-136 MHz coverage, but don't have selectable am/fm, switch to AM automatically when you tune a freq in this range, including the two you've listed above.

The Sportcat's a pretty good radio for about $160, I wouldn't be so quick to overlook it.

I have been watching this thread for awhile and thought I'd put
in my 2 cents. I downloaded Semasoft just last week and have had some
actual success. I do get a lot of preambles, sync and parity errors,
but have received lots of Data. Im using a Sound Blaster Pro and Radio
Shack PRO-34 fed into its input (I've tried both mic and line and both
work) I keep getting a "device in use for wav..." or something like
that error box that keeps popping up. I just move the box out of the
way and do not acknowledge it and everything seems to work. If I try to
acknowlege it, after a couple of acks the software seems to quit, so I
just leave it up. I'm located just west of Indianapolis and have
decoded off of 155.210, 152.480, 152.840 & 909.7875 so far. I do get a
lot of garbage, but there still quite a few good numbers coming across.
I guess you have to take the good with the bad. :)
I try to adjust my volume, so that its just in the higher red band.

good luck!

Yes Patric, you are correct. I wrote that. I=Tyler
Mr. Alexander found it necessary to start one up with me a while ago blaming me for something that somebody else wrote. He really threw a fit about it. He accused me of not knowing how to use the newsgroups and other things. I think it is he who doesn't know how to read the groups.

Tyler wrote the above paragraph Mr. Alexander. (in case you can't figure it out and decide to piss me off again by asking me to ask my mom to help me with the computer)

How are you going to hide a ground plane 25' in the air when you can't hide a discone 25' in the air? Are you going to paint it black? Hide it in a tree? The Ground plane is probably your next best choice. Does your devolopment allow TV antennas or no antennas at all? If they allow tv antennas, hook your scanner up to one of those vertically polarized. It will be directional, but it will work.

: guessing the rest of it is going to be pretty much data. Any interesting
: Military stuff? Any help would be greatly appreciated. Thanks.
: TYler

Most people that scan satellites try to get SCPC (single channel per carrier) or FM2 (FM-squared) signals. SCPC has several hundred radio and audio programs, FM2 has a few music and in-store channels. To do this, you require and existing dish and satellite receiver. For SCPC, you connect the scanner thru an adapter to the dish, and tune in the range of 950-1450Mhz, for FM2, you hook to the demodulator output of the receiver and tune in the range of 0-5Mhz. You use wide FM for the most part, you'll need a scanner such as the AR8000 or Icom R100. For most signals, you'll need a movable large (10-foot) dish, although a few signals can be got with a 3-foot dish on Ku band. Scanners will pick up the signals, but for good sound quality you'll want dedicated receivers. BTW, almost all military info on satellites is heavily encrypted.

Originally, Tandy/Radio Shack (a manufacturer of cellular phones and a member of CTIA) voluntarily kept their PRO-2004 model scanner off the market until they figured out a quick and cheap way to block cellular reception. This led to the [in]famous "diode mod" to restore cellular coverage.

Subsequently, the cellular industry per$uaded Congre$$ to pass more laws to not only make monitoring illegal but to remove all radio equipment capable of such reception from the marketplace. The existing US laws are the compromise result - no new manufacture or importation of any cellular capable scanners after April, 1994.

By the way, the cellular industry association in Canada (whose name escapes me right now) is trying very hard to pull the same stunt with Canadian law. It's just taking a bit longer up there.

>Correct me if I'm wrong but I think you're both right. The 1986
>reference is to EPCA which only covers cellular, thus cordless is
>still covered by the 1934 (?) communications act.

Nope. There is a specific law against monitoring cordless
in the U.S. It was passed in 1994, and actually adds
cordless to the prohibited list in ECPA.

By the way, ECPA covers a lot of things besides cellular.
C-phones are just what gets all the attention. You aren't
supposed to monitor voice pagers, news media remotes, STLs,
certain satellite downlinks, etc., etc. But those services
don't have a special interest industry group like CTIA to
repre$ent them to Congre$$ and protect their interests.

>Thus one can legally listen to anything they want around 46 MHz
>(cordless phones) but they can't tell anybody what they heard.

Incorrect. See above.

>IMHO it's a bunch of hooey. There should be a law against
>unenforceable laws... but then it'd probably be one. ;-)

Exactly right! :-)

gosh, gee Eric....

best you go to a RS super sales person and
ask them to show you where the green books
are with radio frequencies in them....bring
ten bucks to slip to the sales person so they
will feel appreciated....

there are not that many...really, but once you
get into it, you will want to listen to Napa and
Solano Counties and even over in Marin...that can
get really good when they have major fires...all
are great....also the chp and state police and
stuff...

right now you can do this:

police: 155.91
fire: 482.9875

this will get you started.
solano sheriff: 155.49
solano fire: 156.00
napa sheriff: 155.43

search out 42.00 to 43.00 for chp...
there are a few there which will pop up not in the book
listen to 154.905 for car to car and dispatch replies

45.08 is a good one....
151.34 another good fire one
154.34 good fire
benecia operates on sheriff 155.49

don't forget 157.05 coast guard
or 122.50 downed aircraft signals

you want to listen to BART: try 153.15
DOT: 47.02

Might as well listen to Co Co County fire"
46.32 33.48
22 46.24
.38 46.48
.14
.18
154.385 too.... good listening.

concord naval weapons station: 139.50

there exists many more possibilities for you in the RS
freq.book....only 10 bucks plus tip

remember: when you walk into a RS store, make sure you
have an attitude: i am here to save you from poverty.

aloha eric: justd had these delivered by surfboard

Benecia: pd..sher... 155.49
154.92 mutual aid
155.775
155.085

Fire: 156.00
154.34
154.28 mutual aid
155.94 medics and fire 3000 units

Vallejo: 155.91 pd 1
154.83
154.92
155.97 tac
154.95 tac
482.9875 Fire
483.0625
that's it for now

get the RS book and open your ears to what surrounds you....

TRY THIS: HTTP://WWW.NEEDHELP.COM
.WECHEAP.COM
.CHEAPPAY.COM

as for your computer....what is it? 386 or 486?

If you can put 8 megs ram in it, do so. RAM is so cheap lately.
Except at RS.

Also, do you have a mememory manager like Qualititas or Quemm?
you need this like you need oxygen to your heart....very critical
if you are running 386's....even 486.

do a chkdsk and see if anything is out of order...if so,
you either do a chkdsk\f or find the files which are out
of whack. For this you need Check-It or similar.

Try this when you cannot search. Soft boot your unit. Let it
recycle...do a mem test and see where your memory is going.
If youi are on windows...you don't need smartdrive at all. AS
long as you have 8 meg's min. Try : it in your autoexec. and
get use of more mem available.

How do you cofigure your computer's Config.sys

make sure it's: Device=C:\Windows\Himem.sys
Dos=HIGH,UMB
DEVICEHIGH=C:\WINDOWS\EMM386.EXE NOEMS
DEVICEHIGH=C:\WINDOWS\SETVER.EXE

FILES=99
BUFFERS=25
SHELL=C:\DOS\COMMAND.COM C:\DOS \ /e:2048 /p
stacks=0
Lastdrive=C
or D if you have it.....

The mem manager will increase your ram up to 856 Ram under 1 meg.
That's a lot of usable ram over 512 thresh hold. Do a mem
and if you are using less than 512 you are in trouble ... not
enough....it just slows things a lot. Causes DOS programs
to crash...

I run about 659 available ram and I'm on win 3.1 on my 386sx....
plus i use qualititas mem mgr 7....which resally helps

when is the last time yoiu optimized your disk...?
You need an Optimizer program. I use Optimizer. Dos 7 I think
has one built in....you ahve to optimize and get those files in
synch once a month...this could be a problem for you too....files
all over your disk and too long finding links toothers.

try the chkdsk and mem and see what you have running....these
problems will affect your ability to use major amounts of mem
when in the Internet Files....8 meg's is minimal to run good.

don't forget to do: C:MEM /c>prn
if with a printer....print out each major files: such as
autoexec.bat adn config.sys and mem and chkdsk...to hvae a
index.

also: do same on these files prior to changing the parameters
so if there is a logjam you can install them in again and work
on making adjustments as you go.......

win 3.1 is not the best to use with Internet access. It's too
slow and too "prone" to crashing and hanging up

bill conduit
etc.

Sure glad I live in Canada! Nobody's banned radio yet. IMHO if your radio
waves are trespassing on my property and keeps falling down on my antenna
well then I'm going to listen to them. If you don't like it then keep your
signals to yourself ;-) To me there's not much difference between any part
of the electromagnetic spectrum, I'm allowed to enjoy the sunlight that
falls here at least 4 months of the year (Well it is Canada!!!) Then why
not radio.

Hey all you "we like trunked radios in our agency because we can hinder the public from listening"...maybe you should adopt the REAL spirit of community policing and look at what the Dallas Police department has done. They rebroadcast their police transmissions over the internet. You can listen for yourself at: http://www.audionet.com/radio/dallaspd.

I have heard that some far-reaching police agencies have rebroadcasted over cable channels, but I have to admit that this is even a better idea than that. Even as I type this, Dallas police calls are streaming out of my computer speakers. It's amazing!

I urge all agencies that aren't stuck in the backward "whatever we say is a secret, blah, blah..." to consider this as a viable option to keeping some of your frequencies public while at the same time sitll converting to a trunked system. Remember, controlling what the public hears may be better than leaving it up to the scanner hackers that will eventually crack whatever system you put in place anyway...so take the initiative: OPEN YOUR AIRWAVES NOW as a gesture of good spirit.

The situation here is that there are a million codes, but these codes exist solely to prevent access to your line. This prevents someone from going outside your house with their phone and billing calls to your number. But the audio is totally in the clear, the code has nothing to do with stopping eavesdropping.

I will say I've seen misleading representation of what these codes mean writting by puffing marketeers. Like "six digit security code virtually creates your own private channel, shutting out other cordless phones".

Jeffrey,

The Pro 62 is a very "clean" scanner, very little intermod & good rejection of adjacent signals. It's other pluses are;

1. Uses std. AA dry cells (easy to find ni-cads & a 2nd battery holder give you around 15 hours of scanning).

2. Has two power inputs, one for AC power, one for recharging the ni-cads.

3. Small & easy to handle.

You won't like;

1. Small audio speaker & output (if using earphones this won't be a problem).

2. Small, hard to read display w/ poor backlighting.

My first Pro 62 was manufactured in China & was a terrible radio (local weather freqs. bleed over 25 MHz on each side of frequency), I took advantage of Radio Shacks 30 day return & got a Japanese produced unit. That is the one I use to this day. I don't know if there still manufactured in both countries, but if so try to find a Japanese unit.

If the advertisements and manuals say it has a million security codes and the phone owner isn't a radio junkie, I'd say he has a case against the manufacturer, regardless of the price he paid. Yes, us scanner nuts would know it is possible to listen to these phones, but the scanner illiierate would only believe what the manual or salesperson would tell them. Maybe his neighbours did him a favour by telling him they could hear him, but they also put themselves in trouble by divulging radio transmissions.

Perhaps the manuals should make it clearer for the general public what is secure and what isn't.

JUST MY OPINION, NOT LEGAL ADVISE!

Hey, all you guys who said you got the RS catalog for free this year:

I went to one of my local (Rochester, NY) area RS stores last weekend to get a catalog. They wanted $2.95 for it, which I declined.

Is this a manager's choice charge, or has Tandy gone back to the policy that drew so many flames the first time they tried it?

What frequencies are they using below 40 MHz or above 952
MHz?

>So the 100-watt mobiles are not legal. Neither are the frequencies
>normally not for police use. And it requires the users to identify.

I believe the identification rules pertain only to
licensees, not to those using the frequencies under Part 15
or law enforcement exemptions.

Also, 100-watt mobiles are rare in public safety. The few
that exist operate on VHF-low (below 50 MHz). The average
police car transmits with between 5 and 50 watts.

Granted, that still exceeds the "low power" limits, but if
you're going to make accusations, at least be factual.

The Dallas PD is not providing the audio feed to the realaudio:

----------MESSAGE FROM DALLAS PD:

With regard to your questions regarding AudioNet's broadcast of DPD
radio channels:

1. This audio feed is not provided by the Police Department.
2. AudioNet would have to be contacted to answer how the feed came
about and when it was placed on the Internet.
3. These braodcasts, to our knowledge, cover 7 frequencies. It is
my understanding that they use a scanner to "pipe" the channels to
their audio feed.
4. To our knowledge there are no other departments furnishing this
type of service. Several departments have used taped audio clips of
chases and messages from departmental officials but not real time
broadcasts.

Sergeant G. H. White #2233

Hi!

I've just booked a skiing holiday at Mamouth Moutain, California.

I fly into LA, spend one night there then drive along highway 395 through the Mojave desert and Owen Valley to Mamouth (well thats what the brochure says!).

I'd like to programme up my AOR 8000 with PD freqs for the LA area and along highway 395 as well as any interesting freqs in Mamouth.

I know that a lot of information is available in Police call, but as I'm in the UK any publication we this amount of detail is impossible to get hold of!

Thanks for any information

Picking up a particular person's cellphone calls is not possible with
merely a scanner, this requires a surveillance device which costs upwards
of US$10,000. Scanners which tune the cellular band only pick up calls
totally at random, you have no control over who you hear. You can pick
up your own phone if you're very close to it, by turning up the squelch
so you only stop on very strong signals.

: While this whole thing is getting quite off the scanner subject, I would
: like to ask something that I have asked/commented on before. Why do
: people assume that sending something by e-mail means that the addressee
: is supposed to keep it private?

Most people don't, but Mikey seems to believe otherwise, and will insult your ethical standards if you even mention that he sent you e-mail (see previous posts in this thread written by Mikey).

: Addressing the above - if you have something that shows malex007 is
: talking out of both sides of his face, by all means share it! THAT IS -
: if you think that it would benefit the newsgroup.

Unfortunately, (as I mentioned when I got involved in the thread) I deleted Mikey's first e-mail, although he followed up admiting that he sent it. I could, by the way, post Mikey's e-mail to other folks, as they have forwarded it to me with messages along the lines of "Don't let this guy get to you, he think's he's the local net.cop." I choose, at *my* discretion, however, not to post their e-mail to me (but I invite them to do so (or not) at their own discretion. I will let them involve themselves if they so desire).

What I have saved is two sides of an e-mail conversation where I attempted to conduct a reasonable conversation with Mikey (I don't throw insults and foul language around. Read my past posts to figure that one out...) and received in my mail box messages which were full of insults, foul language and a bunch of other crap which "decent people can't stand the smell of...." as Mikey pointed out to Drew Durigan.

At this point, however, I am willing to refrain from posting the e-mail, and to let it drop, provided that Mikey does also, and that I never again find my mail box littered with his junk (foul languaged or otherwise).

: For the record... Anyone that sends me an e-mail is taking their
: chances.

I agree 100%. I just hope that those who do post other's e-mail (or send it to ISPs) send the original message without making baseless accusations... One person who told me of a past encounter with Mikey knows what I am talking about.... And again, I have no intention of posting this person's e-mail, but invite this person to do so (or not) at his own discretion...

Im looking to purchase the OS535 board for my Pro 2035 I want to know if
they are really worth it ?
Ive been scanning for 8 years but not with my computer also want to learn
what some of the decoding does like DTMF, CTCSS, AND DTMF touch tone.
I appreciate any information thanks..

I just returned mine to EEB because it produces tons of self made interference. One of many examples follows: tune into the 2 meter band of ham radio, start at 144.5mhz and tune manually all the way upto 146.0mhz, look for widebanded signals that stretch for 50k or more. In the unit I just returned, I found self made noise at a level of 6 s units. This is very common I am told by the techs at EEB. There are many bands in which this same noise is heard. In fact, there was not a single band that didn't have the interference. Important note: the noise seemed to reach a peak in the mid 150's (the main action band around here!)

The radio was fun but the novelty wore off real fast. If I were going to sink 600+$ into a radio I would spring for the extra 150$ and buy both a BC 3000 and a SONY 2010. It is my opinion that the 8000 is not upto the manufacturing quality control that I've seen with BC. The 8000 does alot, covers alot, and can be alot of fun if you like self made noise that cancels out anything within 10 to 40 k worth of bandwidth.

Is it possible that I was sold a faulty radio? It is entirely possible. It is also interesting to note that after returning the radio for a refund the tech said there was nothing wrong with it and he planned to wrap it back up and resell it! So it is entirely possible that if you act fast you can but the same piece of shit that Electronic Equipment Bank sold me. In addition, the EEB salesman said several times that only licensed dealers can unlock the 800 band. Obviously, the sales person is either really stupid or is a complete liar. In the fall of 95 the magazine "Monitoring Times" reported how to unlock your own radio using one or more of the commercially available software! EEB doesn't have sqwat for customer service either. The first time I tried to return the radio the salesman asked his boss what to do and the boss said all he could do is send in the radio for repair. I demanded a complete refund and they refused! I have since settled the matter sort of but have not got the check yet. I have no desire to visit EEB or the

aor8000 ever again.

Please use this information as just another opinion in the big decision of which radio shall I invest in and where should I get it.

Best of luck

James

Hey, I recently was at a busy airport waiting for a plane, a guy on he other side of the boarding lounge started talking on his cell phone. I wanted to se if I could find his conversation. I searched the cell phone tower band (869-896mhz)..the phones also use 820-849mhz.....didn't ake me long to find a conversation..one where what iheard matched the guy;s lip movements...
be careful what you say on a cordless or cellular...i have heard people give their addresses, credit card numbers..etc...Whenever I see someone with a cell phone, I always caution them wo watch what they say....just to prove my point, I let them listen to a cellular call that i find on the scanner..that makes a believer out of them!!

I've never heard of simply attaching a receiver to an outside aerial causing an overload, even if the impedances are mismatched, without something like a power surge (lightning strike or power line). If it was a transmitter it is possible to blow out the finals if the Standing Wave Ratio (SWR) is much more than about 3.5:1 or so and you transmit anyway.

Hope this helps

Just moved into a duplex from my old apartment. I can hang a REAL
antenna now!

Currently, I am using a Grove Scantenna hanging inside the front
window for my Uniden 3000XLT and 220.

Which is a better upgrade?

1. Grove Scanner Beam Antenna $59.95

2. Professional Wideband Discone Antenna $87.95

And if I get #2, do I need a rotator from Radio Shack to turn it and
tune as necessary?
PS: I am ordering Belding 9913(?) coax for better reception - is this
currently my best bet for coax?

Thanks!

I have seen "wrong" flight numbers used when it is a second section - the
flight is full and they put on a second aircraft, and when the inbound flight
is late so they send the outbound one with a different identifier to avoid
confusion between inbound and outbound flight with the same number. I am sure
there are other circumstances in which these number are also used.

c'mon folks. it's a scanning group - not an English Grammar/Spelling
group.

Most of the spelling errors are not bad spelling, just fingers
tripping over each other.

Many of the visitors to this place do not have English as their first
language. How would YOU ask a technical question in a foreign language
that you hardly know?

Even many of those folk that have English as a primary language cant
spell proper. Only the yanks could get COLOUR wrong, as for PROGRAMME,
look at the way Bill Gates spells it! Whoever thought of spelling LIFT
as "elevator" or PAVEMENT as "sidewalk"

Seriously though, don't criticise wrong spelling, we dislexic folk get
word blind (literally) and cannot recognise a mis-spelt word even
when we try. Genuinly, I am dislexic and I am also a wrotten typist
all I can say is "Thakn hevans fro a good speeil chunker!"

Now, what was that frequency I was lookin for....

>much in Australia.
Hello Matthew

I'm not sure on the dpl but the "pl" is Motorola's way of confusing the situation with regards to what the rest of the world knows as CTCSS! or Sub Audio!

CTCSS stands for Continuos Tone Carrier Squelch System. (I'll explain that later)

Motorola call it "Private line" (hence pl) other vendors and suppliers may call it "subaudio" - It's all basically the same.

Right. What does it all mean.

In essence, the ctcss/pl/subaudio is a low frequency audio tone that is transmitted at the same time as the speech. This tone is usually also quite a low level. and has standard frequencies in the ranges from just a few 10s of hertz to about 200 hertz (I don't have my manuals in front of me at the moment, but the exact range doesn't matter for the purpose of this explanation.) (the frequencies used in the explanation below are also not the set tones but will do for the explanation too.)

This tone is detected by the receivers of the other radio equipment on the RF frequency, and depending on the actual application, they react to the tone accordingly. For example:-

Lets think of a transmitter 150.000 MHz with a ctcss tone of say 71.5 Hz

The could be a repeater that will receive 170.000 MHz and when the repeater detects the ctcss tone of 71.5 Hz, it will assume that this is an authorised used and switch itself on and pass the speech content of the transmission on. (The 71.5hz tone gets filtered out and the users do not hear it)

In another instance the ctcss tone can be used to allow several different user groups or businesses to use a repeater, all on the same frequency, but without hearing each other. This is done as such:-

Company (a) has (say) 65.0hz tone and a fleet of say 20 mobiles
Company (b) has (say) 71.5hz tone and a fleet of say 50 mobiles

Company (c) has (say) 112.3hz tone and a fleet of say 30 mobiles (the actual quantity of mobiles is irrelevant but I mention it to put things into perspective.)

When one of the above companies transmit, their specific ctcss tone (say 71.5) gets superimposed on top of the speech. ALL the mobiles that are tuned to receive the 71.5hz ctcss tone will open up their squelch circuits and pass the speech audio through to the loud speakers as normal. BUT all the radios NOT tuned to open up on that tone will be "Locked out". The receivers will not open up, and in most operations, the transmitters of all the other radios will be inhibited whilst there is a tone present that they don't recognise. - This offers a modicum of privacy, Hence Motorola calling it "private line" or "pl"

The other main reason for using ctcss/pl/subaudio is to help reducing interference from other users on the same frequency. It works in a similar way as above but without the Tx lockout. Lets say you have a radio system on 75.000 MHz with a ctcss tone of 112.6hz and there is a taxi company 10 miles away on the same frequency of 75.000mhz. He will more than likely be issued with a different ctcss tone. This means that his mobile fleet will not be opened up by your transmissions and not will your fleet be opened up by his transmissions.

The above explanation is a bit long winded, but I hope that it helps to understand what pl/ctcss/subaudio is and how it works.

I have only explained the three most common uses of it. There are many other applications such as trunking where a radio goes into scan mode, checking sequentially, a bank of frequencies looking for specific tones and when it finds the correct tone it will stop searching because it has found it's operational frequency for that moment in time.

Etc etc etc ..

Not all connercial radio installations use ctcss, but with the crowding of the radio spectrum, it is becoming essential for most applications. The DTI-RA (radio authorities here in the UK) will not investigate interference reports now-a-days if the interferee does not have ctcss fitted and activated.

Most scanner radios do not have ctcss decoders fitted so that you may occasionaly detect a low frequency rumble or hum from some transmissions (depending on the bandwidth of your radio's audio range)

Some scanners can have a ctcss decoder board fitted retrospectively, check with the supplier of yours to see if one is available BUT if you do have one fitted, then dont forget that one of it's prime uses is to IGNORE a majority of transmissions and only react to the transmission with the correct ctcss tone that it is set to receive. This is ok IF you are looking for say only one fleet anoungst many on the same RF

frequency but it will very much limit the use for listening to others transmissions unless it is either tuned to another ctcss tone or switched off.

Whatever, happy scanning...

DPL stands for "Digital Private Line", works the same as "PL" or "CTCSS" but is digital in nature and a little more finicky on the receiving end. There are many more codes available for DPL and it's industry counterparts known by many different names, but the idea is the same. DPL is becomming much more available and is used mostly in larger metro areas due to channel congestion.

These are some military freqs I've collected over time, heard here in S. Louisiana. They are for the air operations offices of the outfits shown.

There are many more airline ops freqs out there that can be easily captured by searching 128.825-132.000, but those below are a bit tougher to come by.

Corrections, additions, etc. are very welcome for Texas, Miss, Arkansas, Alabama, Florida, California.

73 de tom

Air Ops Freqs

Hello,

I am conducting a non-scientific survey about viewing habits of
people who watch local television newscasts. The survey is
anonymous and the only requirments are you live in the U.S.
and watch the local news regularly.

If you would like to participate, please relpy to this and I will
send you the survey.

Thanks for the help.

>
> Any info really appreciated.
>
> Many Thanks Hi Matt; you didn't mention what service you were listening to, but if you were talking about ham repeaters, there are several reasons why you hrd what you did. Some repeaters have a 'tail' which stays on for a minute or two to reset, others use a 'beep' as a courtesy to tell the other station when to transmit. The 'beep beep beep' you hrd may well have been an autopatch in progress; this is a connection between the repeater and the phone system; the beeping sometimes (depending on the repeater's controller) indicates either a busy or a ringing tone. There are many more possibilities, but again it depends on the service to which you were listening...73s Mike

Well, Matthew, , There is no such thing as a stupid question, , ,
only stupid answers :-}

>How come at the end of a transmission when the radio user 'lets go of
>the ptt button' the repeater either (depending on repeater listening to)
>cuts off straight away or still transmits for a short while. Also some
>go 'beep....beep....beep for a while as well.

Most repeaters drop out just milliseconds after loss of signal
from the user. This causes a "sheese" sound. That's called a
squelch tail, and is common for most repeaters. Some repeaters
use a tone coding system that allows only certain users to hear
what is being transmitted, thus the code tones. When there is
neither, then you are probably listening to a "translator" rather
than a repeater. The translators take the incoming RF signal,
convert it to an IF signal, back to RF and retransmit it, never
going through the audio stages, and thus it has no squelch tail. I
hope that this answers your question, and I hope this isn't
oversimplified for the 'experts' out there. :-}

Saw in the Columbus Dispatch today the state of Ohio is going to take bids on an 800 MHz system to eventually replace the ancient 39-44 MHz communications system.

Supposedly construction is to begin summer of 1997 and be on line 2-3 years later.

Who said that the SR-71's have gone back into service?
The reason they were taken OUT of service was that age was taking
over, and the replacement parts could not be obtained, because the
subs had stopped making them. I personally assisted in
disassembling and transporting Three of them to museums when they
went out of service.

There are only three operational SR's in service that
I know of. Two of them are with NASA's Dreyden Research
Center at Edwards AFB, and the third is "somewhere
else" doing black duty. They were flying the NASA
bird recently, doing tests with sonic booms. They
ran a race track North East of Edwards, and South
of China Lake. You could clearly see the vapor trails.
What they were doing was to take the SR to just AT
mach 1, and monitor it with a closely following T-28.
That was 6 months ago or so. No activity lately. They
were using the Joshua Control frequencies and EAFB freqs.

Another thing that you can do is if you are close to the person that you
want
to listen to, take off your antenna and turn up your squelch all the way
up and
then scan the band. You should only hear the people that are REAL close
to you.

Hmm...I guess all that radiation my phone is putting out has the
potential to cook the little birdies which happen to fly between me and
the cell site?

> Yes, but so are other laws. In this case, the need to defend wilderness
> and reduce the number of wireless-induced emergencies overrides the need
> to place telephone calls from the backcountry. No one really needs a
> telephone in the wilderness.

No emergency is *wireless* induced, ignorance induced, maybe. One may
not need a cell phone in the wilderness, but having one packed doesn't
hurt either. In an extreme emergency, you can always use the antenna to
poke out the eyes of an attacking bear, or an insane RFWS activist,
which ever the case may be.

> Yes, very much so. Our group includes people with a variety of
> backgrounds: environmentalists, lobbyists, telecommunications engineers
> and electronics engineers. We have the knowledge, ability, motivation and
> technical skill to accomplish our goals.

Gee..this sounds awfully threatening. Come to the winderness with a
cell phone, and you may never see your family again.

> Won't you cause injury to innocent parties if an emergency phone call is
> jammed?
>
> In the short run this could happen. But as people realize that cellphones
> are not a substitute for being properly prepared in the backcountry, the

> interference will cell sites is a last resort to achieve these goals.

Hmm...why don't we go a step further and take the brakes out of
people's cars? Everybody seems to think that driving too fast is unsafe
too. So if we make their brakes usless, they'll go slower and thus
safer. So what if a few good people get into accidents? At least

everybody else will drive slower. And if you happen to have an accident near an RFWS jamming site, well then you're just outta luck buddy. With the RFWS in charge, make one mistake, and you're dead. Quite a steep learning cure there.

> All the more reason to reach a legislative solution. Existing cellular
> coverage is a small but fast-growing problem in the backcountry. When
> satellite-based systems come on line, wilderness as we know it will be
> gone forever. We must act now!

Yea..I can just see all those little animals suffering horrible lingering deaths from cell phone induced radiation poisioning.

> At the moment, the society has chosen to remain anonymous due to the
> potential political problems that could occur. For the same reason, we are
> not soliciting new members at this time. The federal government has been

> RFWS has not violated any federal, state or local laws.)

Uh huh...don't want a shoot-out with the FBI? The government has the knowledge, ability, motivation and technical skill to accomplish their goals. Oh, did I happen to mention that we the suposedly *non free-thinking* public have the ability to guide the direction of our government's goals? Hmm..which goal shall I choose?

NiMH batteries do not have the "memory" effect often experienced with
NiCAD batteries. That means that you do not need to ensure they are
sufficiently discharged before recharging. However, they tend to
self-discharge at a higher rate of around 3% per day.

3579. How are Uniden Scanners BC-10 & BC-7?

Source record: 217999

Does anyone have any experience with the Uniden Bearcat BCT-10 Scanning System? A quote of what it does from http://members.gnn.com/IDAINC/bct10.htm (info also available Uniden's site):

The BearTracker is a sophisticated highway alarm system that responds to radio waves emitted from special secondary transmitters installed on most highway patrol vehicles across the U.S. The BCT-10 alarm system informs you both visually and audibly when activity is detected. It also determines signal strength to inform you of the presence and distance of highway patrol vehicles even if they're not using radar!

The BCT-10 also has radar detection (I think, although it is really hard to tell from the Uniden home page).

I'm also curious as to whether the BCT-10's radar detection stuff is good or not?

I'm in California and would be interested in its capability to work with the CHP repeaters.

Funny how our government (FCC specifically) places restrictions on the frequencies that scanners can receive (obviously, cellular), and at the same time, the JPL (NASA, government organization) FTP site hosts an archive containing modifications on scanners to restore those missing frequencies.

I guess it's cool, but why even restrict frequencies in the first place if they're going to run a server containing mods that tell you how to unlock the restricted frequencies? Seems contradictory to me, but hey, that's our government. Don't get me wrong, I'm neither talking bad about our government (at least that's not my intention) or complaining about their archive, I just don't comprehend the double standard.

Check out the Radio Modification archive from the NASA, Jet Propulsion Lab FTP server at ftp://kilroy.jpl.nasa.gov/pub/hamradio/Mods/ it's got a lot of good info.

Later...

It's called a "squelch tail". The length of time it stays on is
determined by the installation. The tones are usually there to let
users know the repeater is reset.

Generally Amtrak uses the road frequencies of the railroads on which it
is running. There are also some onboard services frequencies used by the
crew for communication among themselves.

You would have to know the rail lines on which Amtrak is running to
determine the frequency used. Of course, if you have a scanner which
handles it, you could program all 100 AAR frequencies on your scanner.

3585. Re: Question about repeaters

Newsgroup: rec.radio.scanner
Date: 1996-11-10 00:00:00 UTC
From: Brian Zentis <bzentis@ncinter.net>
Message-ID: <01bbcf53$36b223a0$8710f6cd@bzentis-ppp>
Source record: 218005

When the person talking lets go of the PTT switch the repeater hangs for a few seconds to allow any other users to respond without dropping the repeater carrier. This is called the squelch tail and is set at the discretion of the person who runs the repeater. Since the FCC requires repeaters to not run continuously they have a timout timer that shuts off the transmitter if a carrier is on the input frequency for a specified time. You may hear hams talk about timing out the machine; that means that someone got long winded and ran past the timer. When one person stops transmitting the timer resets, and to let everyone know that the timer is reset (and to allow for others to break in) a beep or two is transmitted. This is called the coutesy tone. Some repeater operators like to have a very short squelch tail with no courtesy tones and it may give the impression that you are listening to a simplex transmission...others have long tails and elaborate tones (especialy if remote recievers are used in the system).

Hope that explains it...Brian

From: Brian Hall <bhall@cougarnet.byu.edu>
Message-ID: <3286BA81.2E5A@cougarnet.byu.edu>
Source record: 218006

I know that the PRO-29 has some built-in block on the cell freqs, but I'm curious if there's any way around this. I heard mention of a "virtual downgrade" and was wondering if maybe this could restore the missing freqs on a PRO-29.

Is the only way to restore freqs. on a PRO-29 to replace the CPU?

Is the PRO-29 sold in other countries (maybe UK?) where there is no block on the cell freqs?

Please respond via email. Thanks.

I suggest Rail Scan for the Amtrak freqs. Remember to look under the railroad who owns the tracks
for freq's not just Amtrak. Frequently Amtrak simply has run-through rights with the track owner, and
uses those radio channels as well.

As for the phones, most rail-phones are simply train mounted cell phones. <G>

3599. Re: bincancel:41 large binaries:AR701:@@NCM

Newsgroup: rec.radio.scanner
Date: 1996-11-10 00:00:00 UTC
From: red@redpoll.mrfs.oh.us
Message-ID: <ARMM-Report-701.a@redpoll.mrfs.oh.us>
Source record: 218047
Cross-posted to: alt.retromod,rec.arts.anime.misc,rec.arts.sf.starwars.misc,rec.aviation.homebuilt,rec.music.hip-hop,rec.music.industrial,rec.radio.scanner

Large binary posts do not belong in unmoderated discussion groups.

I run a program that searches for, and issues advisory cancels for,
large binaries in the akr, biz, comp, misc, news, rec, and sci
hierarchies.

I have issued 41 cancels for large binary files (average size 68,628.5
characters - total size 2,813,770 characters) posted to 6 different
unmoderated discussion groups in the rec hierarchy as follows:
31 rec.arts.anime.misc
5 rec.music.industrial
2 rec.aviation.homebuilt
1 rec.radio.scanner
1 rec.music.hip-hop
1 rec.arts.sf.starwars.misc

This pointer is being posted to each affected group listed above.
Follow-ups are directed to news.admin.net-abuse.misc.

If you want to see exactly which file was deleted from a particular
group, read the full report in news.admin.net-abuse.announce. The
full report can also be found in alt.nocem.misc and alt.retromod.
Look for AR701 in the subject, or, if your reader supports it, use
this <URL:news:ARMM-Report-701@redpoll.mrfs.oh.us>

The criteria used to search for this batch of large binaries were:
NEWSGROUPS: Unmoderated akr, biz, comp, misc, news, rec, or sci
(except for comp.binaries.apple2, comp.bugs.2bsd,
and rec.games.bolo)
BINARY: base64, binhex, uuencode, and xbtoa encoded files, etc.
SIZE: > 100,000 characters [(size * (# of parts - .5)), if multi-part]

If you must post a binary to Usenet, please post it *only* to an
appropriate binaries newsgroup such as alt.binaries.misc, and do *not*
crosspost it to non-binaries groups. Then, if you like, post something
in the appropriate discussion group telling people where to find the
binary in the binaries group (a pointer to the binary). This will
permit news administrators and users to decide for themselves whether
to receive the binary files.

For more information about binary cancels, see the bincancel FAQ,
<URL:http://ursula.uoregon.edu/~geniac/binfaq.txt>.

Please direct public feedback to news.admin.net-abuse.misc and private
feedback to red@redpoll.mrfs.oh.us. In the interests of preventing

cross-posted flame wars, please honor the followup-to header and do
not cross-post your reply to multiple groups. Thanks for your
cooperation.

Best wishes,
Dick

I'm looking at the SC150 and I have some questions:

Will it scan more than one bank (10 frequencies) at a time, or can I have it scan more than one bank at a time???

How does the search work??? Does it just start at the beginning of a band and step through the frequencies until it finds activity??? Does this work for all bands???

Is it easy to program frequencies???

Is it a good beginners scanner???

Thanks for the information.

Perhaps this is actually a two-way radio, that is unprogrammable by
hand but by computer by a GE dealer? No such handheld scanner exists..

Anyone notice the HIV test commercial where the girl uses a cordless phone to get her results? Paraphrasing "...you use a coded number to request the results of your test so no one knows but you..." Now, snap to Anytown, USA where Sally is on her cordless (again) and Bobby is quietly listening in next door (she leads such a promiscuous lifestyle that Bobby never misses an opportunity to eavesdrop). <Dial Tone>..."This is the HIV test results hot line, please enter your 10 digit code from your test kit for results..." Both Sally and Bobby wait with baited breath for the results...

Correction

Attaching an outside aerial can cause signal overload, but I've never
heard of that "blowing" a scanner. Sorry about the misnomer.

This is why in many states you may not have a mobile scanner in your
car . What you say is right and is the main reason many police
departments have changed freq's. over the years. Now many are
switching to 800mhz Trunked but then scanner manufactures just build
scanners to find em!! Aint it great!!

Well, I was wrong about the Airstream. It is marked RS model 12-626,
like you mentioned, but is a Jetstream. I was writing from memory since
the radio was buried under mounds of stuff. I just pulled it out. It is
in good shape except the 'chrome' paint is rubbed and worn in spots.

In principle you are quite correct, NTSC recorded tapes cannot be used
in PAL VCRs.

BUT, many modern PAL system VCRs have a possibility to play (but not
record) NTSC recorded tapes.

If viewing NTSC tapes is important enough to the original poster,
he might consider getting a new VCR that will play NTSC tapes.

Yes. While scanning, just press the number of the bank you want to
add/delete.

>How does the search work??? Does it just start at the beginning of a band
>and step through the frequencies until it finds activity?

Bottom frequency - press LIMIT
Top frequency - press LIMIT
Press SEARCH

>Is it easy to program frequencies???

Type it in and press ENTER

>Is it a good beginners scanner???

It's a great scanner. Given a choice, however, I'd go with the 230XLT
(more features)

Hi Todd,

> I was just wondering what modifications are required for the AR2700 to be used
> with the Optoelectronics Scout Reaction Tuning. Their ads say a mod is
> required, but not what kind.

You need to add a 2.5mm mono socket with the centre connection running to
the RX In on the RS232 and the earth running to earch. It requires a litle
bit of dissassembly and making a suitable hole down the side of the receiver
for the socket - its not a big job but really does depend if you are "happy"
doing this sort of work.

The possible alternative is the SAC-8000 from Opto which was designed for
the AR8000 but I assume works with the AR2700 - just uses the flat RS232
connector in the battery compartment and has a 2.5mm socket on the end. Thus
would be all but impossibe to use mobile hough as you wouldn't be able to
get the batteries in at the same time.

Hope that helps.

Here we go again with Hollywood's version of reality. Tell me, couldn't anyone hire a radio guy as an advisor?

Cellphones from 30,000 feet over Amsterdam (the televangelist not the frantic parents on the FliteFone). And when Heathrow wanted "privacy" on the VHF aviation band they instructed the pilot to go to his "company frequency". Well, one scanner enthusiast in England quickly looked in his reference material (Beyond Police Call?) for Quantum Airlines company frequency and heard all about the infection onboard. He quickly tried turning this info into gold by calling the media. I'm not sure, now, if I liked the protrayal of a scanner monitor...

3626. Uniden SC-150Y/B - opinions?

Newsgroup: rec.radio.scanner
Date: 1996-11-11 00:00:00 UTC
From: Tommy <bigtommy@ix.netcom.com>
Message-ID: <3287EA30.10FF@ix.netcom.com>
Source record: 217824

Just what the subject says...any takers on this one?

I am considering on getting this to replace my 60XLT-1 (my first scanner). The SC-150Y/B is something to think about for me since I am under money and time constraints.

I will eventually ditch the 60XLT-1 and even more eventually get something nice, like the BC-3000/9000, the top RS', or AORs'. But I am not ready for a Base yet.

In any case, enough unrelated, bandwidth wasted, and waste of your precious real and Internet time, any opinions on this one or perhaps another in its 'class' in terms of money and features?

TIA

Tom

> Just a note about what is criminal or not criminal. I work at one of those "reputable" suppliers
Yes, one time it was legal to sell scanners with the cellular frequencies. Then about 3 1/2 years
ago a law was passed saying that scanner manufacuters must disable the cell freqs (this is where the
posted "Mods" come from - to eliminate the block placed in the scanner. Then about 2 years ago
a much more tougher law (thanks to the eavesdropping by our then Gov. Wilder on opponent Sen. Robb)
that scanner manufacturers were told to make the sets "unmodifiable" - some are easier than others.
The way you can tell the difference at,Radio Shack, for example, if the case is light grey then it falls
in the first category and can be modified, if it is dark grey then much more difficult to modify.

Now, to add more confusion, a law was passed that prohibited listening to cordless phones on ALL freqeucies,
including the 49 mhz band. Now all scanners (new) sold at RShack have that block incorporated - the way
to check is that the original box it came with has a small red, orange, green dot stuck on the box. We had
to send all our radios in that were not modified to exchange for the blocked ones!

Some may, however, slip through the cracks. But watch out for the light grey/versus dark grey cases. The
radios look and act ecactly (same Pro-number) except for the block.

Good Luck!

Here's the original post to rec.radio.scanner for the AR8K narrow / wide filter switch mod. I've added some comments, and a diagram and a schematic after the original post.

==========

Subject: AR8000 FILTER MOD DETAILS
Date: Tue, 06 Aug 96 19:19:13 GMT
From: wm8p@infinet.com (Bob Mills)
Organization: InfiNet
Newsgroups: rec.radio.scanner

Hello AR8000 owners,

To my knowledge no one has actually posted a filter mod, here is what I did. This is my approach and I only know it works well on my AR8000. Your results may vary. Others may have a different solution that works better or worse.

THE GOOD NEW:
Is it worth the effort. In my opinion YES!
The search mode is vastly improved on the SW bands. Search stops on the primary frequency and not 1 or 2 times before and after. Readability of SW stations is vastly improved. In some receiving instances it reduces adjacent channel interference noticeably. On AM receive for aviation frequencies a pronounced improvement in audio quality is noted. You will be able to select WIDE or NARROW for AM, NFM, USB, LSB.

THE BAD NEWS:
This is a difficult mod to perform. I have been a ham for over 30 years and have extensive homebrew experience. It took all my skill and a magnifying glass to perform this mod without damaging the radio. IF YOU ARE NOT QUALIFIED DO NOT ATTEMPT THIS MOD!
Find a qualified helper.

There is no way to adequately describe the locations on the circuit board to be cut and soldered too. You will have to buy or borrow

a service manual.

Study the electrical mods described below and then using an ohm meter and the service manual find the locations to modify on the circuit board.

WHAT IS MODIFIED ELECTRICALLY:
The 4khz filter (F4) circuit is paralleled by a a jumper that is used to bypass the filter for WIDE reception. This selection process is accomplished by switching diodes on each end of the filter and bypass.

Find U2 pin 11 (AM, FM filter bypass) line. Trace this line to a 22K resistor that connects to the switching diodes (near the F4 filter). The voltage from pin 11 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the 22K resistor.

Find U2 pin 4 (SSB, CW filter inline) line. Trace this line to TWO 22K resistors that connect to the switching diodes (near the F4 filter). The voltage from pin 4 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the TWO 22K resistor junction.

Unfortunately there is no way for me to put a schematic in for this next part but if you draw it out on paper you should be ok. You are going to mount a small switch on the radio. This must be a SPDT (On-None-On)switch.

<Note: Original post stated that a DPST switch was required. This mod requires a SPDT switch and was confirmed via e-mail with the original poster. I modified the previous paragraph. See the schematic following the mod. Scott>

Connect a wire from the WIDE side of the switch to the single 22K point.

Connect a wire from the NARROW side of the switch to the dual 22K resistors point.

Connect TWO 1N914 style switching diodes together to the switch common.
Connect them with the black band facing the switch.
Connect U2 pin 11 to the open end of one diode and U2 pin 4 to the open end of the other.

What you have done is to install a switch to reverse the normal filter selection of F4. The 1N914 diodes serve to prevent turning on the BFO in the AM mode and to prevent grounding when in the WIDE SSB mode.

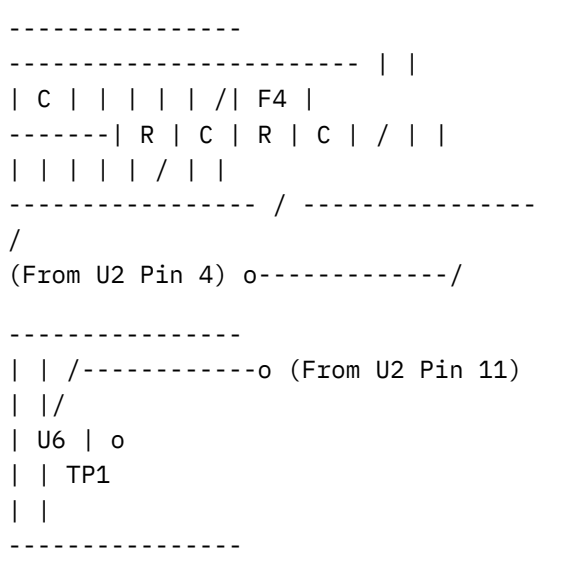
If you have questions you may email me but if you post a reply all may benefit. I make no guarantees, your results could vary. You might not have much fun performing this mod but you will enjoy the results.

73's
Bob
WM8P/GROL/GMDSS/M

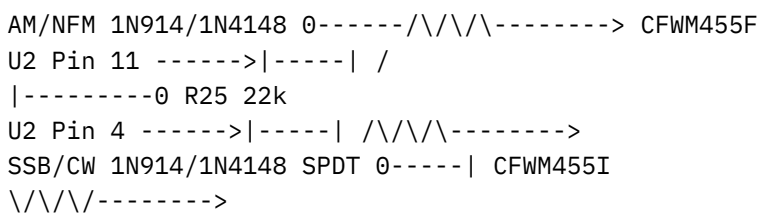
==========

After receiving and studying the AR8K service manual, I performed *my interpretation* of the aforementioned mod on my AR8K and the results were worth the effort. As Bob stated above, the mod was difficult to perform. Primarily due to the surface mount parts and trying to trace out the path from the IF board U2 to the filters using a DMM. I would also STRONGLY suggest obtaining the service manual for the AR8K in order to perform the mod. Having the service manual made all the difference to successfully performing this mod. I ordered mine from EDCO @ 703 938-8105 ($29.95 plus shipping) and it took about a week to get. BTW, a magnifying glass helps tremendously.

The 22k ohm resistors (R22, R25, and R26) are located on the back side of the IF board while U2 (74HC4094) and the traces that I cut were on the front side of the IF board. The U2 pin 11 trace is just above TP1 and "runs" from under U6 (TC4066) to a plated thru hole on the right. The U2 pin 4 trace is above the pin 11 trace and "runs" from a plated thru hole (immediately below 4 vertically located semiconductors -- 4.7k, 0.0033uF, 4.7k, and 0.01uF) to the right and then "cuts" diagonally up to and under F4 (CFWM455I). What follows is defineately *not* to scale:



Here's the schematic of the actual mod.



R26 22k

I chose to solder wires directly to U2 pin 4 and pin 11 and the other wires to the isolated traces (on the 22k ohm resistor side) due to the space limitations in the area where I cut the traces and also due to the fact that it is hard to solder wires to the small traces. In order to provide stress relief to the wires, I tacked them down to the IF board with a *dual melt* glue gun (at LOW temp using *dual melt* glue -- doesn't melt the insulation and peels off easily, if necessary). You may want to test this out on some spare wire first to ease your mind. I installed a sub miniature SPDT (after shortening the toggle) on the top of the AR8K case between the "DIAL" and "VOL" silkscreen. Like the Opto Scout manual suggests, I would recommend using only an exacto knife to create the hole. Unless you feel like drilling out some components in your AR8K. :>(

As always, any mods you perform are at *YOUR OWN RISK* and will void your warranty. There's always a potential for possible damage to your AR8K. If you don't feel comfortable with performing the mod, I would look for a competent local tech that someone recommends.

>

A couple months ago I purchased a new BC3000 scanner. I don't remember how long it was until I noticed the problem but when I moved the coax coming from the antenna the signal strength would change or the signal would get very noisy.

I thought I had some bad coax or a bad connector. I couldn't find a problem with these so I opened up the scanner and both of the solder joints for the BNC connector were bad. The connection for the center conductor was just "sort of" attached to the solder but would move. When the connection for the ground was wiggled a little it just came loose from the solder pad.

Re-soldering both connetions really helped. You might want to check this.

I also found that it helps to keep the locking ring on the BNC connector tight so the connector cannot move around and therefore allow the

connections to the solder pads to move.

Mike

The SC150 has worked great for me, but if you live in a good sized
city, those 100 channels fill up real quickly. I only wish there were
some mods for it, or at least some instructions from some of the more
technically inclined readers on how to find the discriminator output.

What you are referring to is the "hang time" after the squelch tail. It is there to keep the repeater from having to re-key in case of a short following transmission. The time depends on how the controller was set up. It also saves some wear and tear on the hardware.
As far as the noise bursts are concerned, there are many ways to eliminate those. In most cases, repeaters are activated by subaudible tone, and when the user unkeys, the tone from his radio is sent 180 deg. out of phase for an few milliseconds, cancelling the decoder on the other end. This is called "squelch tail elimination" and was originally used due to the reeds used to produce the tone were mechanical, and the reverse burst quenched the vibration of the reed faster.
As far as the beeps, they are what is known as a courtesy tone. They are used to tell the person on the other end that the transmission is finished and it is the next person's turn to talk. Some can be quite elaborate, if you happen to listen to some of the Amateur repeaters. When the tones sound, they also let you know that the 3 min. "time-out timer" has been reset also.
Hope this answers your question...

#
#Thanks!
#
#PLease EMAIL me your answers.

I was going to build a scanner using the tuner from a vcr, with a 49 Mhz
reciever for the IF. The channel circutry was going to be one of those
pushbutton tuning controls (the ones with the thumb tuned pots),which
it's control IC had an up/down control.

: >car.

: Which states? I'm just curious.

I've heard New york has laws against it. Adn New Jersey did for a while, but now the current law is that it's illegal to use a scanner to aid in conducting illegal activity, to satisfy the buffs who are just doing idle monitoring.

: >What you say is right and is the main reason many police
: >departments have changed freq's. over the years.

: To aviod detection?!? I think the main reason is technology not
: interception.

Tell that to Middlesex County, NJ. Their trunked system (and several others I've heard, particularly the GE/Ericsson models) puts tones at the end of each units transmissions, so that your scanner is delayed in finding the next frequency being used to continue the conversation. Even heard one of their techs describing how it works over the air when they were testing it out.

Granted, in most cases, it's done for technology and cost reduction. But there are some places that could just fine with a non-trunked, dependable repeater system in the 400Mhz bands. Right now in Central NJ, there are _four_ different trunked systems that I know of in the same county, all of them being used by only one agency each. Frankly, GE and Motorola have them duped, and aren't selling these systems for what they were originally designed for: a single system that adequately handles the needs of several different agencies at once.

Sorry you are wrong on this British Airway's ICAO callsign is Speedbird on
ALL their flights. Speedbird 1 to 4 are the Concorde's and the other numbers
are various other types.

> wait with baited breath for the results...

Good example.

I think that a solution to all this is to simply require that cordless
phones be packaged with a warning that calls could possibly be
monitored.
I didn't notice any obvious warning like this on the cordless I bought,
but I didn't look that hard.
I use the cordless for its convenience and when I need the privacy, I
just switch to the cord phone. Simple.

Would such a warning hurt sales? Maybe a little. But people should
know what they are buying and how they work. A lot of folks know
the risks already. People still buy cigarettes......

3650. Re: Can anyone explain what pl/dpl is?

Source record: 217848

David L. Butlien (butlien@cyburban.com) wrote:

: As I understand it, DPL is simply a digital coded PL, rather than a
: sub-audible tone.

Sort of. DPL and PL are both sub-audible as both operate
below 300Hz tone frequency. The 38 standard PL tones are:

67.0 71.9 74.4 77.0 79.7 82.5 85.4 88.5 91.5 94.8 97.4 100.0 103.5
107.2 110.9 114.8 118.8 123.0 127.3 131.8 136.5 141.3 146.2 151.4
156.7 162.2 167.9 173.8 179.9 186.2 192.8 203.5 210.7 218.1 225.7
233.6 241.8 250.3

There are also 13 more PL tones that some manufacturers have
squeezed in between the higher tones. I don't have a list
handy.

DPL (Digital Private Line) or DCS (Digitally Coded Squelch)
allows 80 minimum usable, 83 recommended, or a maximum of
106 codes. The following are the 80 minimum usable.

23 25 26 31 32 43 47 51 54 65 71 72 73 74 114 115 116
125 131 132 134 143 152 155 156 162 165 172 174 205 223
226 243 244 245 251 261 263 265 271 306 311 315 331 343
346 351 364 365 371 411 412 423 431 432 445 464 465 466
503 506 516 532 546 565 606 612 624 627 631 654 662 664
703 712 731 732 734 743 754

DPL/DCS consists of a 23bit PWM word at a data rate of
approx 110 bits/sec ??? and a deviation of +/-750Hz.
There is also a 180ms of 134.4Hz "turn off" tone to
eliminate the blast of squelch noise when the signal drops.
All of this is sub-audible.

The OptoElectronics DC440 will decode all the above as
well as DTMF (touch-tone). $260 list.

If you have a period counter connected to the discriminator
output of your scanner, you can measure the PL period and
calculate the PL frequency. You will need a 300Hz low
pass filter to prevent speech from ruining the measurement.

>>to) cuts off straight away or still transmits for a short while. Also
>>some go 'beep....beep....beep for a while as well.

"Squelch tail" is what it is called. In the Amateur world, we use it -
and sometimes the accompanying "tone/beep/chirp" to allow another
operator to "break in" the conversation with either something to add or
a priority or emergency communication.

In commercial units (well, in all units, actually), the use of a squelch
tail allows the repeater to stay "on" during a conversation, thereby
eliminating a little wear and tear of the equipment (preventing it from
haveing to re-turn-on each and every transmission).

gtseng@westworld.com (George Tseng) writes:
>
>Has anyone heard whether the CHP is going to a trunked system?
>
>--GCT

A CHP Sergeant I know just took that statement with
a grain of "redundancy".....NO

There are limitations to what the CHP can use. TRUNKED
is one of them. Low FReq works best for CHP who must go
on all roads and byways and avenues and dells in Calif.

That would mean being able to have a cell site in every
dell and terrace and alley and mountain lion trail and
former stagecoach back roads ... meaning much money.

When you consider that San Fran was thinking of spending
$20 to $30 million for their "now we don't want it because..."
system....just think : 49 square miles of san fran.

How many square miles of Calif times about a figure of say
\ times number of chp vehicles and then stations and then
numbers of chp officers who need the portables to wear and
use....Governor Wilson is spending money on PRISONS and not
on CHP.

Too costly. BUUUUUUTTTTTTT!

In two years there will be several satellites in place for
this radio system to work for all police systems....a very
sneaky idea....but it's nationwide and very sophisticated.

This may be what you heard about. What this means is is that
California cops on beat can talk to any police center in the
nation if they need info about some crook they arrest...or
instdant feed back of a picture from any other police agency
who may have a want on this crook. Instant is spelled Instant.

This is the brave new world we all will wake up to one year.
By the year 2000 it may be in place in a lot of major police
systems....INSTANT communication between any agency on the
system....and what a database they will have in case the feds
get involved....OH HAPPY DAYS.

When You Awake....

Remember: the new satellites will be able to transmit live phone calls too....to anyone on the system. Most cops have cell phones in cars and switched to digital they can put you on the phone and ask the receiver it they recognize you as being the "suspect" who escaped from that agency's clutches.

What a wonderful thing technology is?

Crooks who grow long hair and beards and other wig stuff and by the time they are put on phone...they have changed looks. But I am sure that George Lucas Special Effects will be able to produce software which will redesign one's face putting these acruments back on that face.....

From: dg715@cleveland.Freenet.Edu
Message-ID: <566hov$a2m@alexander.INS.CWRU.Edu>
Source record: 217926

Police agencies are allowed to use ANY public service bands in
their city that are not being used by other city departments.
Thus, if a channel is licensed to a city's service department,
but that department doesn't use it, the police may LEGALLY make
use of that channel.

That's the law.

That also means they may use an active channel licensed to another
city department whenever that department isn't using it, such as
using the garbage collection channel at night when the garbage
crews aren't working. In fact, to be technical about it, since
only one person can use a channel at one time, the police can
use any city channel. After all, at the moment the police and
dispatcher are transmitting, the other city department licensed
to that channel isn't using it.

As for legal ID's...someone said stations must identify themselves
every 30 minutes. Not true. Stations must identify themselves
every time they begin transmitting. If a city's dispatch service
is identified as KQA 934 (just an example, don't go looking to see
who KQA 934 is...or if it even exists), as soon as a broadcast
from dispatch begins with, "934 to car 12," it has legally identified
itself.

Stations that transmit continuously (no break in the carrier) are
required to identify themselves once an hour as close to the top
of the hour as possible. The automatic morse code broadcasters
that automatically run a coded ID every 10:00 or so cover a
licensee's backside in case the radio operators don't identify
themselves as required.

Someone also wrote asking why the use of Morse code when nobody
uses Morse code these days. Obviously, somebody uses Morse code.
It's just that the person who wrote that isn't one of those people.

1 June, 1996

Can someone please tell me how to get help?

My name is Lonnie T. Ledbetter and I live in
El Dorado, Ca. A few years ago I stumbled onto a crime
being committed by the Government in Yolo County,
California. U.S. Citizens were being sent to prison
so that others could be forced to sell their property
at a greatly reduced rate and all for the sole purpose
of building a six hundred million dollar marina.
When the marina was proposed it was to be built on the
Sacramento River, which seperates Sacramento and
Yolo county. Less than two miles from our state
capitol,and yet across the river and in another county
is the newly incorporated city of West Sacramento. For
many years, West Sacramento has been to Sacramento,
what Tijuana is to San Diego. A place where business
men, congressmen, or what ever could go for a little
forbidden pleasure time with a hooker or what ever,
without having to worry about being detected by wives,
family, or constituants. In 1986, all of this changed
when West Sacramento Incorporated, and became an
independant city of Yolo County.
Looking toward the future they immediately set
out to become a part of the twentith century. One of
the suggestions, and indeed, the only important
suggestion in regards to my posting was that a marina
be built on the Yolo county side of the Sacramento
River, to be enjoyed by both Yolo County, and
Sacremento County residents. Not only this, it would
be located adjacent to Old Sacremento, which has
become a roaring success with the tourist industry
since it's redevelopment.
It seemed the perfect answer except for one small
detail. Where it was to be built, in order to achieve
maximum success, would require the requisition of
private land which was occupied by many private
residences and it would become prohibative if the
government were required to pay fair market prices
for the land needed for the marina, and yet the
Constitution of the United States under the fifth
amendment, states "nor shall private property be
taken for public use, without just compensation".

Well, this created a dilima, but not an insurmountable one. The government simply reasoned that just compensation equals the fair market value. With this thought in mind, it was only logical, that the fair market value must be reduced on all desired property, thereby enabling them to acquire the property in accordance with the constitution at what would be considered just compensation, at which time the government could force local resindents to sell their property at a greatly reduced value.
Well, we are all familiar with the phrase "there goes the neighborhood" when an undesirable or a person of different color or nationality moves in and upsets the "status quo". With this feeble thought in mind our wonderful government decided that all that was necessary was to classify the neighborhood (West Sacramento) a high crime area, thereby making it undesirable property, which would subsequently reduce the just compensation value by as much as fifty to seventy five percent, which would make the marina project a feasable plan.
With all this in mind, all that was left was to buy the local judges and police agencies, along with the U.S. District court, which could be done for a fraction of the monies saved by reducing property values. And so "let it be said, let it be done" became the law of West Sacremento.
With a little reasoning, it was obvious that to classify the area a high crime area, arrests would have to increase. No problem. Simply arrest the persons that are constantly present on West Capitol Ave. and who make easy targets for arrests as it is their lifestyle and instead of sending them to prison, simply release them as they are the homeless and indigent, and will surely be arrested again within a few days. This began an endless cycle of arrest which rapidly increased the local crime statistics, which were needed to declare West Sacremento a high crime area. The government immediately saw the only problem with their thusfar sucessful project, and that was that arrest records have to be substantuated with reasonable prison sentences. I personally, do not know how many prison years will offset how many arrests in a justifiable manner, but for now, and only for the purpose of clarity, let's assume that every ten arrests should reflect five years in prison sentences. If this is true, we have a problem. If we start sending our arrestees to prison for their crimes, it will only be a short time till we have no one left to arrest. We cannot send them to prison regardless of the crime

charged, as we need them to be released and re-arrested in order to keep the crime stats continuously spirling upward. However, those stats are no good if not offset by prison sentences stats. And then comes the stroke of genius... Someone figured out: If we arrest a West Sacramento "street person", he will almost always return to the streets of West Sacremento (his home), and will subsequently be arrested again, which will continue to bolster our arrest statistics. But, if we arrest a person from another county, when he is released he will probably return to his home county and will be of no further value to us, other than the one original arrest. So, why not take all out of county residents which will have no further value to us in terms of arrests, and sentence him/her to prison terms that will offset the arrests of local arrestees.
This seemed to be a great idea and for the past ten years, persons being arrested in West Sacremento for any reason have been given more than double and triple the required time in prison, as persons in other counties of the State of California.
At this time I will take time to remind you of my original post. I stated that I was from Sacramento County and was arrested in Yolo County (West Sacremento) and was offered eight years in prison in exchange for a guilty plea. The charge was for posession of methamphetamines (quantity was .22cc) which is less than a useable amount. The arrest was made after the police illegally kicked down my door, and beat me and my seventy year old mother.
I was arrested on a misdemeanor and was offered eight years in prison in exchange for a guilty plea. I declined their offer and for more than eight years have suffered atrocities and human rights violations much too numerous to be adequately covered in this message. I will list some of the more important ones and hope you might be able to tell me where to find help.
I was first subjected to a pre-trial hearing which was held behind locked doors and closed to the public. The only person's present were the judge (Donna Petre), and my assigned public defender (Donald Lown). The district attorney did not even bother to show up.
After being returned to my jail cell I filled out a petition for a writ of Habeas Corpus. Without going in to details it took three years for that petition to get through the courts. It was denied at every level and was actually held by the Circuit Court of the United States for the ninth circuit for more than two years. The Supreme Court of the United States refused to issue a

writ of Mandamus. A little more than thirty days later
it was denied without a hearing or explanation.
While all of that was going on I was held for
eighteen and a half months without benefit of a jury
trial. After filing the petition for the writ, the
judge, public defender, assistant district attorney
(Robert L. Day), and court stenographer (Susan Gorsch)
falsified the transcripts from my preliminary hearing to
conform to the complaints made in the petition. Those
transcripts are filed under two different numbers to
this day in the county recorder's office.
I made forty seven court appearances and spent
eighteen and a half months trying to get a jury trial. I
finally pleaded guilty to a misdemeanor in exchange for
being released with a sentence of time served.
I have subsequently filed more than twenty five
lawsuits in the federal courts and have been under
attack by the F.B.I. who use's everything in their
inventory to intimidate and torture me. High-Tech
equipment is used on me in my home and I am continually
harassed on the highways. All local news media is
somehow being suppressed and my telephone is tapped
and my U.S. Mail is confiscated if it is addressed to
anyone that might be of help.
Of the twenty five lawsuits filed in the United
States District Court for the Eastern District of
California, the following charges have been labeled
frivolous.
Denial of privilege of Habeas Corpus.
Denial of access to U.S. Courts for more than
eight years.
Eight Years of torture by the F.B.I. and various
local police agencies.
Attempted murder of U.S. Citizens, by agencys of
the U.S. Government.
Cruel and unusual punishment.
Use of automatic weapons placed around my home
for the purpose of intimidation.
Destruction of my home by the F.B.I.
Mock trials and hearings behind locked doors.
Conspiracy between my public defender, the
assistant district attorney, and the presiding
judge to falsely imprison me for eight years for
the sole purpose of offsetting arrest statistics
with appropriate prison statistics.
Bad faith prosecutions.
Torture of U.S. Citizens by the U.S. and State
of California Governments.
False imprisonment.
Illegal search and seizure.

Confiscation of U.S. Mail for the purpose of
keeping me isolated.
Denial of due process of law.
Denial of the right to a speedy trial.
Denial of the right to be represented by counsel.
Denial of the right to a fair and impartial judge.
Denial of the right to trial by jury in both
criminal and civil cases.
Perjury by court officers.
Perjury by court appointed professionals.
Denial of right to call witnesses on my own
behalf.
Denial of the Equal protection of the law.
False arrest.
Police brutality.
Falsification of court transcripts by judges,
public defenders, assistant district attorneys,
and court stenographers.
Extraction of false confessions by use of false
imprisonment.
Mind control techniques being used on citizens
by the F.B.I.
Violation of the fourteenth amendment to the
Constitution of the United States by the President
of the United States.
Denial of all human and civil rights as
guaranteed by the Constitution of the United States.
Illegal actions by a U.S. Magistrate.
Criminal cover-up by state and federal courts.
Falsification of court documents by court
officials.

All of the above charges were made in the District
Court of the United States for the Eastern District
of California and were judged frivolous and dismissed
without plaintiff ever seeing a jury or opposing counsel.
Following is a list of those case numbers for
verification through the court. All dismissals have been
upheld by the Circuit Court of the United States and
labled "NOT FOR PUBLICATION". Certiorari has been denied
by the United States Supreme Court.

CIV-S-89-1339
CIV-S-89-1336
CIV-S-89-1337
CIV-S-89-1338
CIV-S-89-1340
CIV-S-89-1420
CIV-S-89-0142
CIV-S-90-0245
CIV-S-90-0284

CIV-S-90-0286
CIV-S-90-1434
CIV-S-90-1439
CIV-S-90-1530
CIV-S-90-0037
CIV-S-90-0055
CIV-S-90-0080
CIV-S-90-0081
CIV-S-92-0081
MISC-95-0322

All of the above cases have been dismissed and judged frivolous and labled "not for publication". There are still three cases pending in the District Court and one in the Court of Appeals.
Of the cases in the District Court, one case (Civ S-95-1929) is against the State of California for which the clerk has entered a default but refuses to issue the judgement in accordance with the Federal Rules of Civil Procedure. It has been in default for five months and is for $275,000,000.00.
Another case (Misc.-95-0278)has been filed against the F.B.I. and has been held by the court for more than eight months and the clerk's office continues to refuse to issue process in accordance with the Federal Rules of Civil Procedure. I continue to be denied access to the courts and continue to be tortured by the F.B.I. and other police agencies.
All telephone calls I attempt to make for help are intercepted by the F.B.I. and all of my U.S.Mail is confiscated. I just recently discovered the Internet and will continue to try to get my story out by Email. I had a home page unitl last night. When I tried to view it this morning I found that all of my files had mysteriously dissappeared off my computer. When I attempted to re-install my home page my access was blocked and my phone connetion went dead. So if you receive this message, please try to acknowledge receipt of it by Email to dotm@inreach.com . If I am successful in getting this message to anyone, I would appreciate it if you would pass it on to anyone and everyone that will read it. I'm praying for responses to be sent to the U.S. District Court of the United States for the Eastern District of California, 650 Capitol Mall, Sacramento, California 95814, United States of America. The District Court has now labelled me a vexatious litigant in an attempt to keep me out of the courts. It probably would have worked except the F.B.I. refused to stop the torture which leaves me with nothing to lose. The F.B.I. has obviously decided that my death will be the only

acceptable end to this ordeal.
The purposes of the actions by the Yolo County Court, and the Federal Courts is to cover up the conspiracy that was revealed to me through my eighteen month ordeal there.
The courts are handing out, outrageous prison sentences to all out of county residents arrested there, for the purpose of offsetting an astronomical arrest record being created by arresting local residents and releasing them so they can be re-arrested. The purposes of all this is to justify the construction of a $600,000,000.00 marina.
The Federal Government is contributing to this elaborate conspiracy by donating $50,000.00 periodically to Yolo County for conducting so called sting operations which add to the already astronomical arrest records.
Due to my attempts to expose this government corruption I have been subjected to tortures that are much to bizarre to even be mentioned here but can be proven if I ever get a jury trial as guaranteed by the seventh amendment to the Constitution. I am constantly harassed on the highway by hundreds of automobiles. I presently live on California state highway 49 which normally handles three or four cars per hour, but since I moved here seven months ago the traffic has increased to more than one hundred cars per hour which goes night and day through rain or shine.
Some of the less drastic tortures include the artificial infestations of my home with rats, mice, earwigs, spiders, snakes, living funguses, etc. These have all been complained of in the U.S. District court and have been labeled frivolous.
On March 16, 1996, my mother died in the Hospital when she learned that she no longer had a home to return to. She had shared the nine years of torture and just could not go on. So far, I have lost my mother, my home, my family, my friends, all of my possessions collected over fifty years, all of my mother's possessions collected over seventy five years. This letter only scratches the surface of what has been done and is being done to me every day.
Knowing how outrageous all of the above sounds, I would like to say that all court documents are available for fax to anyone that might be interested. I am interested in reaching human rights organizations that are willing to help. If that is impossible I would like to reach large numbers of people willing to write to the District Court and the President of the United States and request that I be given and immediate jury trial in accordance with the Constitution.

At the present time the State of California is in default on a $275.000.000.00 lawsuit. The default has been entered by the clerk but Dan Wagner of the District Court refuses to issue the judgement in accordance with the Federal Rules of Civil Procedure. The clerk's entry of default is available by fax to any interested party. Any help you may be able to give me will be greatly appreciated.

Sincerely,

Lonnie T. Ledbetter

November 5, 1996

Since my last update as seen above, District Court Judge Garland Burrell, the judge that set aside the $275,000,000.00 default and then dismissed the case has followed the lead of district Court judge David F. Levi and has filed an order stating that my appeal is in bad faith which revokes my informa pauperis status as with the case above. Reason given is that the case is frivolous. And so once again a District Court judge rules that the constitution of the United States is a frivolous document since this case was based on direct violations of the constitution. District Court docket number is cv-95-01929. I filed an appeal on 26 Aug, 1996 in the ninth circuit court, Docket number 96-16619.
I now have to file a request to proceed informa pauperis and will post the results as soon as they are available. At least I was served a copy of the order this time so that I can file the request. When judge Levi filed his order I was never served with a copy and the circuit court supposedly reviewed my case and determined that I was not entitled to informa pauperis status before I knew anything about. Updates will continue to be posted as they occur so if you continue to visit my homepage you will be able to watch the Federal Courts as they continue to violate the Constitution and label it frivolous, in this continuing criminal cover-up.

10 November, 1996

Since my last update above, Judge Burrell of the United States District Court continues to try to outdo his continuing string of ridiculous rulings. A few days ago I received his latest order which grants Judge Stroud Attorney fees. In just two short months now, Judge Burrell set aside a $275,000,000.00 default, granted immunity to all defendants and dismissed the
